MEMO TO: J. Carter Napier, City Manager

FROM: Andrew B. Beamer, P.E., Public Services Director
Terry Cottenoir, Engineering Technician

SUBJECT: Presentation of Results and Recommendations of Roadway Survey by IMS Infrastructure Management Services as a Part of the Citywide Pavement Condition Index Survey, Project No. 18-094.

Meeting Type & Date:
Council Work Session
February 25, 2020

Action Type
Information

Summary:
IMS Infrastructure Management Services (IMS) is currently under contract to develop an index survey to help manage the roadway network within the City of Casper in a cost effective manner. IMS has provided field surveys that will help provide an understanding of the current status and needs of the roadways. The data has been compiled and reported in multiple-year street rehabilitation plans that optimize the pavement quality and minimizes annual expenses. The plans have been developed based on factors that are customized to meet the needs of the City and optimized using cost benefit techniques.

IMS has prepared a presentation to detail the results and recommendations of the survey to City Council. Jim Tourek, West Region Client Services Manager for IMS, will lead the presentation and will be able to answer any questions by City Council.

Financial Considerations:
None

Abbreviation or Acronym	Definition
$k	Dollars in thousands ($,000)
$M	Dollars in millions
%SP	Percent Spreadability - component of deflection analysis
AC	Asphalt Concrete - asphalt streets, flexible pavements, also know n as ACP
ACP	Asphalt Concrete Pavement - asphalt streets, flexible pavements, also know n as AC
ART	Arterial roadw ay functional classification
ASTM	American Society of Testing Methods
Avg	Average
BCI	Base Curvature Index - component of deflection analysis
Brk	Break
CAL	Coarse Aggregate Loss
CDV	Corrected Deduct Value - part of the ASTM D6433 PCI calculation
COL	Collector roadw ay functional classification
Crk	Crack
DefICON	Deflection Condition - structural load analysis based on traffic loading and deflection
DMD	Dynamic Maximum Deflection - temperature corrected deflection
Dvdd Slab	Divided Slab
DynaCON	Dynamic Condition - structural layer analysis
ft or FT	Foot
ft2 or FT2	Square foot
FunCL	Functional Classification
FWD	Falling w eight deflectometer
GCI	Gravel Condition Index
GFP	Good - Fair - Poor
GIS	Geographic Information System
GISID	GIS segment identification number
H&V	Horizontal and Vertical
IRI	International Roughness Index
Jt	Joint
L&T	Longitudinal and Transverse
LAD	Load associated distress
LOC	Local roadw ay functional classification - same as RES
LOG	Lip of Gutter
m	Metre or meter
M	Moderate
m2	square metre or square meter
MART	Major arterial roadw ay functional classification
Max	Maximum
MaxDV	Maximum Deduct Value
MCOL	Major collector roadw ay functional classification
mi or Mi	Mile
Min	Minimum
MnART	Minor arterial roadw ay functional classification
MnCOL	Minor collector roadw ay functional classification
MOD	Moderate
NLAD	Non-load associated distress
OCI	Overall condition index, also know n as PCI
Olay	Overlay
PART	Primary arterial roadw ay functional classification
Pavetype	Pavement Type
PCC	Portland Cement Concrete - concrete streets
PCI	Pavement Condition Index - generic term for OCI
R&R	Remove and replace
RART	Rural arterial roadw ay functional classification
PWF	Priority Weighting Factor
Recon	Reconstruction
Rehab	Rehabilitation
RES	Local roadw ay functional classification - same as LOC
RI or RCI	Roughness Index
S	Strong
SART	Secondary arterial roadw ay functional classification
SCI	Surface Curvature Index - componenent of deflection analysis
SDI	Surface Distress Index
SI	Structural Index
STA	Station or chainage
Surf Trtmt	Surface Treatment
TDV	Total Deduct Value
W	Weak

1.0 EXECUTIVE SUMMARY & RECOMMENDATIONS

PROJECT SUMMARY

In 2019 IMS Infrastructure Management Services, LLC (IMS) was contracted by the City of Casper to conduct a pavement condition assessment and analysis update on approximately 285 centerline miles of City maintained asphalt and concrete roadways alike.

IMS mobilized their Laser Road Surface Tester (RST) to conduct an objective assessment using industry standard pavement distress protocols such as those found in ASTM D6433-11. At that time, the City's network average Pavement Condition Index was found to be a 59 and the City's backlog (roads below a PCI of 40) was at 14%. *See section 4 for more information*

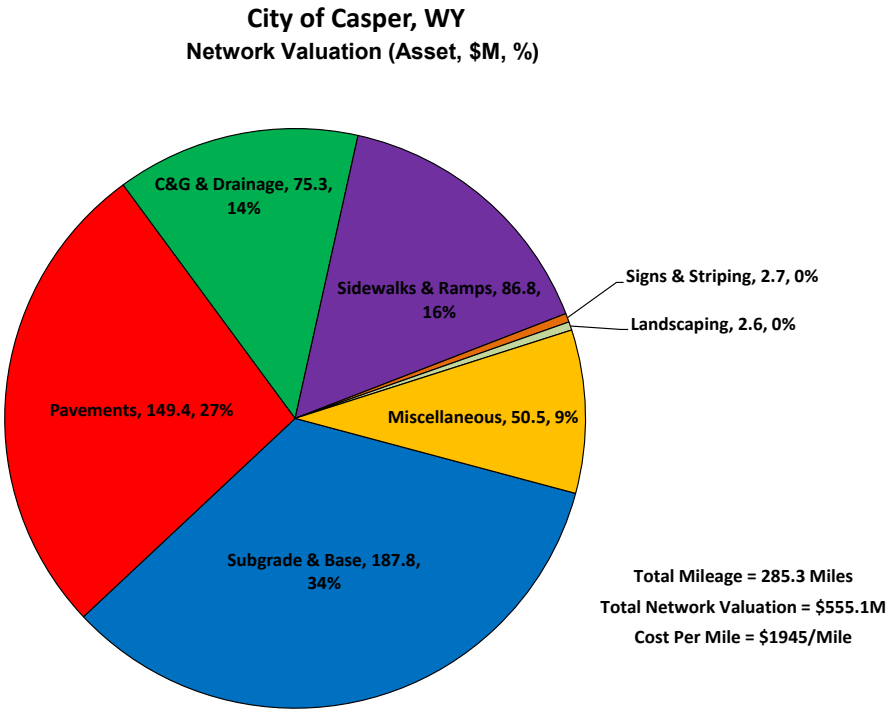

Figure 1- Replacement Value of Roadway Network

As seen in **Figure 1**, Casper has just over 285 centerline miles of roadway, encompassing nearly 6.2M square yards of pavement surfacing, which is predominantly asphalt. At an average replacement cost for a typical roadway just over $1.95M per mile, not including the value of the land, the City has over $555.1M invested in its paved roadway network.

SUMMARY METRICS OF HEALTH

Pavement Condition Index (PCI) – The PCI score is a ranking assessment on the overall health of a pavement segment on a scale of 0 to 100. The network average PCI is a good global indicator of a network's overall health. *(Explained in section 4)*

Percent of Excellent Roads – Roads with a condition category of Excellent are those that score between a PCI of 85 to 100.

Backlog –Backlog is the Very Poor and Poor roads (between a PCI of 0 and 40) that represent a portion of the network in need of extensive rehabilitation such as full and partial reconstruction. Using sound pavement management and finance principles, a very healthy network will have a backlog of 10% or less.

Casper met zero out of three of the metrics for evaluating the quality of its roadway network.

- Casper's network average pavement condition score is slightly below the national average currently seen by IMS of 60 to 65, with the City's average scoring a 59.
- The number of streets rated Excellent is below the minimum recommended target of 15% at 4.0%
- The backlog amount is slightly above the average value of 12% at 13.5%.

BUDGET SCENARIOS

See section 5 for more information

The current annual budget for Casper is $3.7M per year dedicated to pavement preservation and rehabilitation. This will increase the backlog to 25% while reducing the average PCI to a 54 over 5 years. Please note this number is an annual budget average across all 5 years of the analysis horizon.

The steady state budget is designed to maintain the current PCI of 59 and equates to a budget of $6.6M annually.

EXECUTIVE SUMMARY CONCLUSION

The Casper network has an average PCI of 59 and a backlog of 13.5%, with most of the network landing in the Fair PCI range. With the City's existing budget, the network conditions will continue to deteriorate into the mid-50s PCI range and backlog will continue to increase over time. It is worth noting that the City does have a fair amount of streets approaching the end of their lifespan where overlays can be effective, representing a percentage of the network at the steepest part of their deterioration curves.

2.0 PRINCIPLES OF PAVEMENT MANAGEMENT

2.1 PAVEMENT PRESERVATION

Preservation of existing roads and street systems has become a major activity for all levels of government. Because municipalities must consistently optimize the spending of their budgets, funds that have been designated for pavement must be used as effectively as possible. The best method to obtain the maximum value of available funds is through the use of a pavement management system.

Pavement management is the process of planning, budgeting, designing, evaluating, and rehabilitating a pavement network to provide maximum benefit with available funds.

A pavement management system is a set of tools or methods that assist decision makers in finding optimal strategies for providing and maintaining pavements in a serviceable condition over a given time period. The intent is to identify the optimum level of long-term funding to sustain the network at a predetermined level of service while incorporating local conditions and constraints.

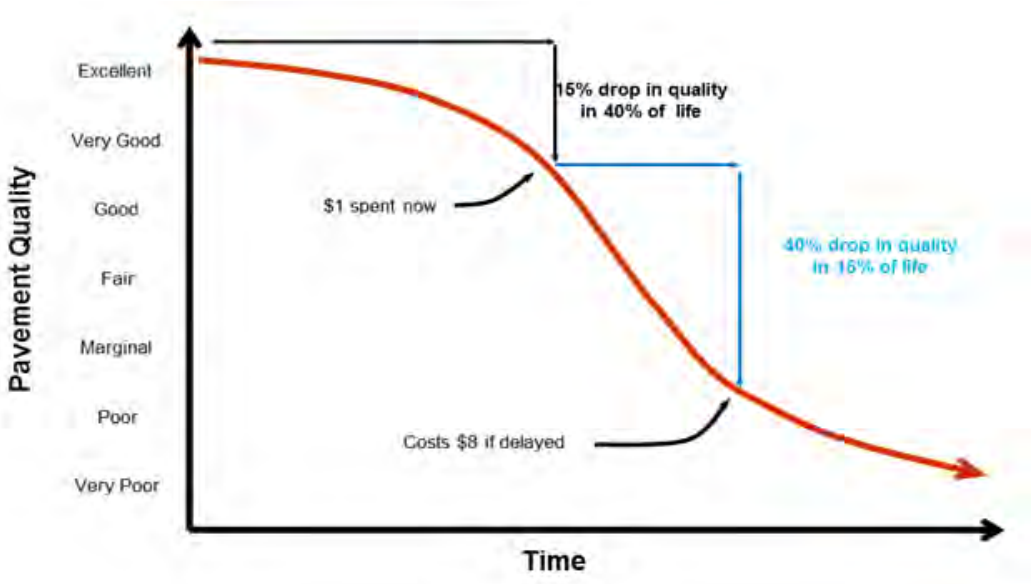

Figure 2 – Pavement Deterioration and Life Cycle Costs

As shown as **Figure 2**, the streets that are repaired while in good condition will cost less over their lifetime than those left to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets require more frequent reconstruction, thereby costing millions of extra dollars.

The key to a successful pavement management program is to develop a reasonably accurate performance model of the roadway, and then identify the optimal timing and rehabilitation strategy. The resultant benefit of this exercise is realized by the long term cost savings and increase in pavement quality over time. As illustrated in **Figure 2**, pavements typically deteriorate rapidly once they hit a specific threshold. A $1 investment after 40% lifespan is much more effective than deferring maintenance until heavier overlays or possibly reconstruction are required just a few years later.

Once implemented, an effective pavement information management system can assist agencies in developing long-term rehabilitation programs and budgets. The key is to develop policies and practices that delay the inevitable total reconstruction for as long as practical yet still remain within the target zone for cost effective rehabilitation. That is, as each roadway approaches the steepest part of its deterioration curve, apply a remedy that extends the pavement life, at a minimum cost, thereby avoiding costly heavy overlays and reconstruction. **Figure 3** illustrates the concept of extending pavement life through the application of timely rehabilitations.

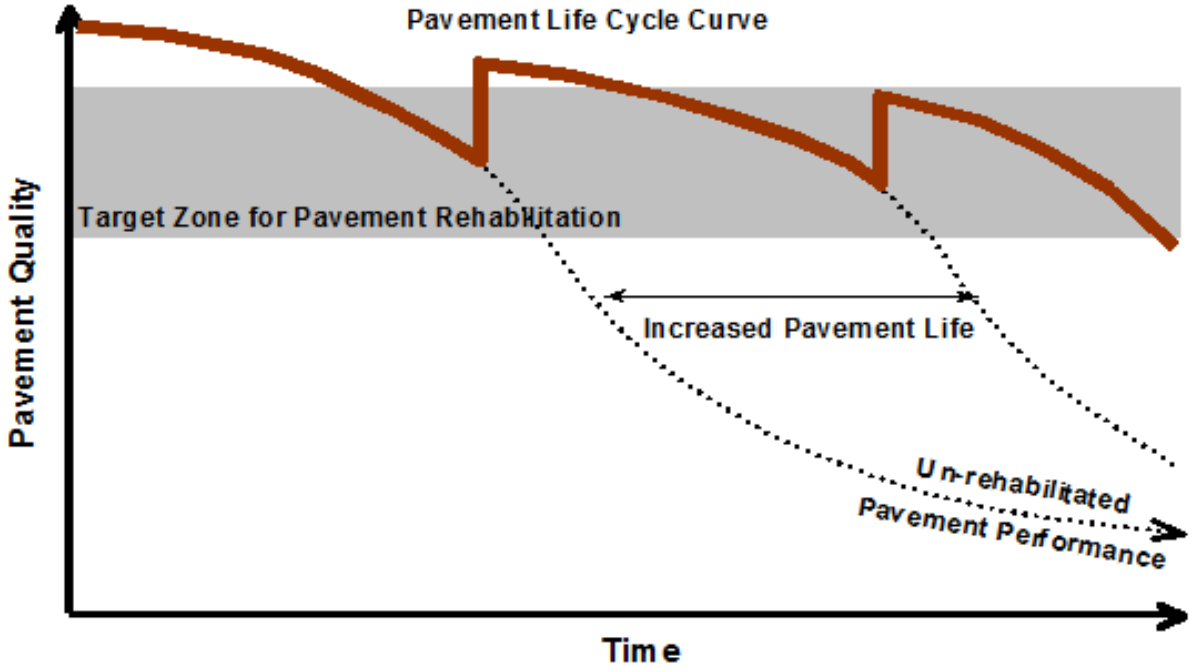

Figure 3 – Pavement Life Cycle Curve

Ideally, the lower limit of the target zone shown in **Figure 3**. would have a minimum PCI value in the 60 to 70 range to keep as many streets as possible requiring a thin overlay or less. The upper limit would tend to fall close to the higher end of the Very Good category – that is a pavement condition score approaching 85. Other functions of a pavement management system include assessing the effectiveness of maintenance activities, new technologies, and storing historical data and images.

For Casper, a prioritization methodology based on pavement condition, pavement materials, functional class, and strength rating was used to analyze the network condition and develop the proposed 5 year rehabilitation plan.

The analysis methodologies and data collection technologies were based on *ASTM D6433 Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys* (hereinafter ASTM D6433) for assessment of pavement surface condition and the International Roughness Index (IRI) for quantification of pavement roughness on all City streets. These measurements of pavement quality are combined to form an overall 0 to 100 Pavement Condition Index (PCI), with 100 being the best.

2.2 ECONOMIC IMPACTS OF MAINTENANCE & REHABILITATION

The role of the street network as a factor in the City's well-being cannot be overstated. In the simplest of terms, roadways form the economic backbone of a community. They provide the means for goods to be exchanged, commerce to flourish, and commercial enterprises to generate revenue. As such, they are an investment to be maintained.

The overall condition of an agency's infrastructure and transportation network is a key indicator of economic prosperity. Roadway networks, in general, are one of the most important and dynamic sectors in the global economy. They have a strong influence on not only the economic well-being of a community, but a strong impact on quality of life. Well-maintained road networks experience multiple socioeconomic benefits through greater labor market opportunities and decreasing income gap.

As a crucial link between producers and their markets, quality road networks ensure straightforward access to goods and drive global and local economies. Likewise, higher network quality has a strong correlation to improvements in household consumption and income. Roads also act as a key element to social cohesion by acting as a median for integration of bordering regions. This social integration promotes a decreased gap in income along with diversity and a greater sense of community that can play a large role in decreasing rates of poverty.

Conversely, deterioration of roads can have adverse effects on a community and may bring about important and unanticipated welfare effects that the governments should be aware of when cutting transportation budgets. Poor road conditions increase fuel and tire consumption while shortening intervals between vehicle repair and maintenance. In turn, these roads result in delayed or more expensive deliveries for businesses and consumers. Economic effects of poor road networks, such as time consuming and costly rehabilitation, can be reduced if a proactive maintenance approach is successfully implemented. To accomplish this, a pavement assessment and analysis should be completed every few years in an effort update the budget models and rehabilitation plans. As shown below, the IMS Laser Road Surface Tester (featured in **Figure 4**) was mobilized to Casper to conduct an objective survey.

Figure 4 – Laser Road Surface Tester (RST)

3.0 THE PAVEMENT MANAGEMENT PROCESS

3.1 FUNCTIONAL CLASS REVIEW

As part of the scope of this assignment, the functional classification designations currently used in the Casper pavement management program were adopted for their use in the pavement analysis.

Although there is no uniform standard for classifying pavement into functional classes, The Federal Highway Administration (FHWA), American Public Works Association (APWA) and Institute of Transportation Engineers (ITE) offer some broad guidelines on how to assign classifications that were followed in this study.

The City's functional classification definitions used in the assessment are as follows:

1. **State Highway (SH)** – A very small portion (<1%) of the network that was surveyed are considered State Highways. These roads were included in the analysis, but were not chosen for rehabilitation within the 5 year plan under the current budget.
2. **Minor Arterial (MnART)** – Continuous and discontinuous cross city and inter-district corridors that are 2 to 4 lanes across and generally have a centerline stripe or a designated bus route. The ADT generally falls in the 10,000 to 20,000 vehicle per day range. They are typically spaced on the ½ or ¼ mile section line and on occasion, may have a short non-landscaped median.
3. **Collector (COL)** – Continuous and discontinuous cross City and inter-district corridors that are 2 to 4 lanes across and generally have a centerline stripe or a designated bus route. The ADT generally falls in the 1,000 to 10,000 vehicle per day range. They are typically spaced on the ½ or ¼ mile section line and on occasion, may have a short non-landscaped median. Major collectors are also assigned to streets segments leading to, or adjacent to, a major traffic generator site such as a regional shopping complex. Collectors form the entrance to communities and may have a decorative landscaped median of short duration.
4. **Local (LOC)** – These are the majority of the street segments consisting of all residential roads not defined above or as industrial/commercial.

The paved roadway network consists of 4 functional classes, covering approximately 285 miles of pavement. The average pavement condition index (PCI) of the roadway network is a 59 and the network's primary pavement type is asphalt. The following table and **Figure 5** summarize the functional classification splits within the system.

City of Casper, WY
Network Summary by Functional Class

	Pavetype	Network	State Highway	Minor Arterial	Collector	Local
Segment (Block) Count	All Streets	3305	14	216	490	2585
	Asphalt	3231	14	173	471	2573
	Concrete	74	0	43	19	12
Network Length (ft):	All Streets	1,506,396	5,316	97,065	220,201	1,183,814
	Asphalt	1,471,049	5,316	79,469	209,888	1,176,376
	Concrete	35,347	0	17,596	10,313	7,438
Network Length (mi):	All Streets	285.3	1.0	18.4	41.7	224.2
	Asphalt	278.6	1.0	15.1	39.8	222.8
	Concrete	6.7	0.0	3.3	2.0	1.4
Average Width (ft):	All Streets	37.5	53.5	50.2	40.0	35.9
	Asphalt	37.3	53.5	48.2	40.4	35.9
	Concrete	47.7	0.0	58.8	31.9	43.2
Network Area (yd2):	All Streets	6,277,707	31,585	540,974	979,313	4,725,835
	Asphalt	6,090,501	31,585	425,969	942,813	4,690,134
	Concrete	187,206	0	115,005	36,500	35,701
Current Pavement Condition	All Streets	59	61	66	67	56
Index (CPCI)	Asphalt	58	61	65	67	56
9/25/19	Concrete	69	0	71	67	62
Pavement Condition Index	All Streets	59	61	67	68	56
(Surveyed PCI)	Asphalt	59	61	66	68	56
	Concrete	69	0	71	68	63
Current Backlog (%)	All Streets	14	Percentage of Network with a PCI < 40			
Current Network Index	All Streets	51	Cautionary Network Index			
Surface Distress Index (SDI)	All Streets	60	64	65	67	57
9/25/19	Asphalt	59	64	63	67	57
	Concrete	73	0	76	69	67
Roughness Index (RI)	All Streets	57	54	68	68	53
9/25/19	Asphalt	57	54	70	69	53
	Concrete	60	0	61	63	54

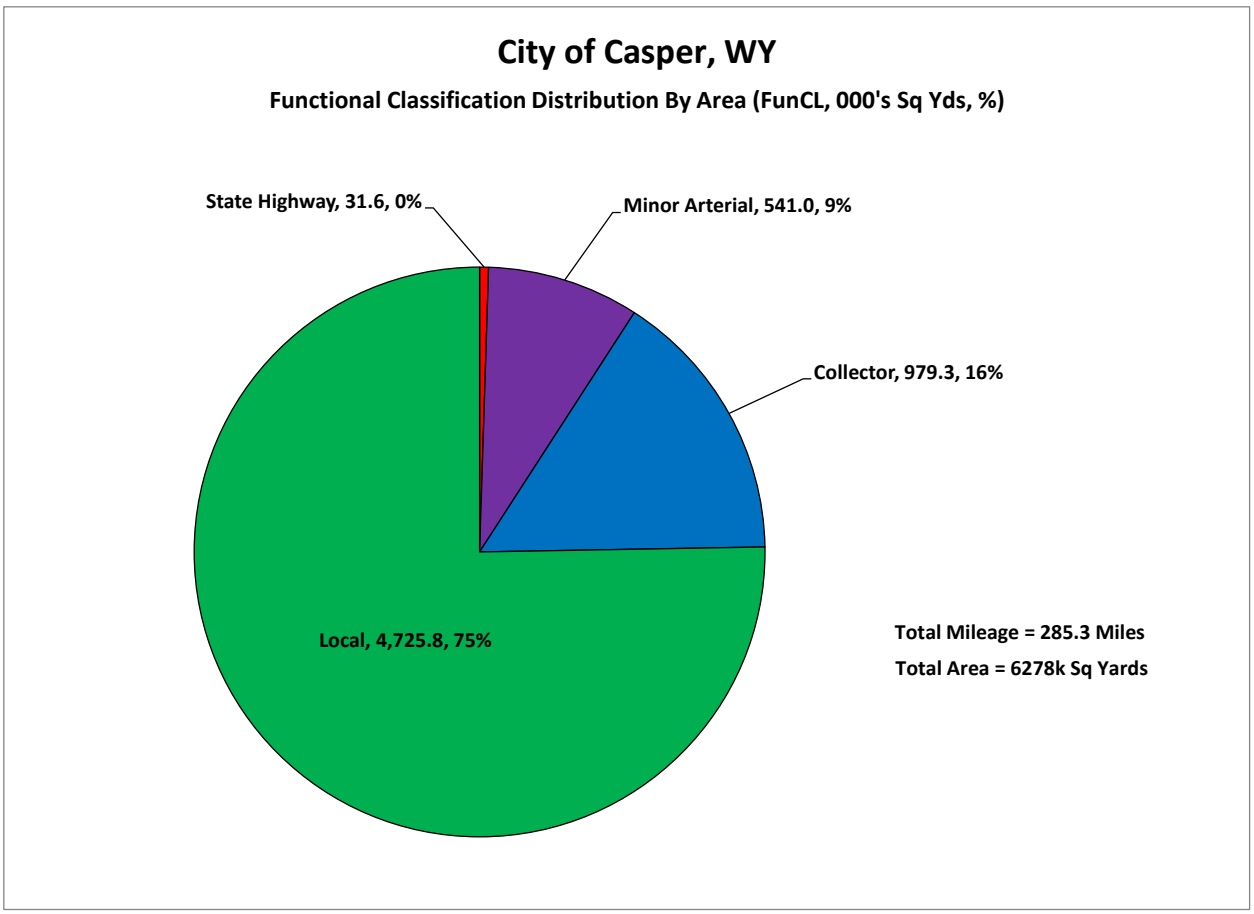

Figure 5 – Functional Class Distribution by Milage

As discussed later in this report, the functional classifications also play a critical role in the rehabilitation candidate selection process as Arterials are generally given preference over other rehab candidates due to their higher traffic counts and steeper deterioration curves.

3.2 ASSEMBLY OF DATA INTO PROJECTS

Casper's Geographic Information System (GIS) was used as the basis for segmenting the roadway network on a block-by-block basis. Each segment was assigned a unique identifier referred to as a GISID, establishing a one-to-one relationship between the GIS and the street inventory. The segments form the basic building block of the pavement management system and are where all attribute and condition data are stored.

The centerline segments were aggregated together within the pavement management system to form logical projects that the analysis and rehabilitation program are developed against.

- Arterial projects run from major intersection to major intersection up to 1 mile in length.
- Similar to arterials, collector streets within a neighborhood were aggregated together to form a single project where practical.
- Local streets along a homogenous route were aggregated together along with adjacent side streets to form a small neighborhood based approach.

Segments were joined only when the pavement condition and functional classification were homogeneous in nature such that when joined they have a relatively uniform condition that may be rehabilitated using a single strategy.

The following figure (**Figure 7**) highlights the projects, used for the analysis. An electronic version of this map is appended to this report.

3.3 FIELD SURVEY METHODOLOGY

Following a set of predefined assessment protocols matching the pavement management software (ASTM D6433), a specialized piece of survey equipment – referred to as a Laser Road Surface Tester (Laser RST, pictured on page 5) – is used to collect observations on the condition of the pavement surface, as well as collect high definition digital imagery and spatial coordinate information. The Laser RST surveys each local street from end to end in a single pass, while all other roadway classifications are completed in two passes.

Key pavement condition data elements collected by the Laser RST include:

Surface Distress Index – The Laser RST collects surface distress observations based on the extent and severity of distresses encountered along the length of the roadway following ASTM D6433 protocols for asphalt and concrete pavements. The surface distress condition (cracking, potholes, raveling, and the like) is considered by the traveling public to be the most important aspect in assessing the overall pavement condition.

Presented on a 0 to 100 scale, the Surface Distress Index (SDI) is an aggregation of the observed pavement defects. Within the SDI, not all distresses are weighted equally. Certain load associated distresses (caused by traffic loading), such as rutting or alligator cracking on asphalt streets, or divided slab on concrete streets, have a much higher impact on the surface distress index than non-load associated distresses such as raveling or patching. Even at low extents and moderate severity – less than 10% of the total area – load associated distresses can drop the SDI considerably. ASTM D6433 also has algorithms within it to correct for multiple or overlapping distresses within a segment.

For this project, extent and severity observations were collected, processed, and loaded into the pavement management software. Within the software, the following distresses, listed in order from greatest to lowest impact, are presented as a 0 to 10 rating for review and reporting:

- Alligator Cracking – Alligator cracking is quantified by the severity of the failure and number of square feet. Even at low extents, this can have a large impact on the condition score as this distress represents a failure of the underlying base materials.
- Wheel Path Rutting – Starting at a minimum depth of ¼ inch, wheel path ruts are quantified by their depth and the number of square feet encountered. Like alligator cracking, low densities of rutting can have a large impact on the final condition score.
- Longitudinal, Transverse, Block (Map), and Edge Cracks – These are quantified by their length and width. Longitudinal cracks that intertwine are the start of alligator cracking.
- Patching – Patching is quantified by the extent and quality of patches. When the majority of a roadway surface is covered by a patch, such as a large utility replacement, the rating of the patch is minimized. All potholes are rated as patches.
- Distortions – All uneven pavement surfaces, such as depressions, bumps, sags, swells, heaves, and corrugations, are included as distortions and are quantified by the severity and extent of the affected area.
- Raveling – Raveling is the loss of fine aggregate materials on the pavement surface and is measured by the severity and number of square feet affected.

- Bleeding – Bleeding is the presence of free asphalt on the roadway surface caused by too much asphalt in the pavement or insufficient voids in the matrix. The result is a pavement surface with low skid resistance and is measured by the amount and severity of the area.
- Similar distresses were collected for concrete streets including divided slab, corner breaks, joint spalling, faulting, polished aggregate, and scaling.

Roughness Index – Roughness is recorded following the industry standard "International Roughness Index" (IRI), a measure of the change in elevation over a distance expressed as a slope and reported in millimeters/meter. The IRI value is converted to a 0 to 100 score and reported as the Roughness Index (RI) as follows:

$$\mathbf{RI} = (11 - 3.5 \times \ln(IRI)) \times 10$$

ln(IRI) is the natural logarithm of IRI.

In common terms, a newer street would generally have a Roughness Index above 85, while one due for an overlay would be in the range 40 to 70. Failed streets typically have roughness values below 40.

Structural Index – The network of streets was not tested for structural adequacy, instead, the relationship between the final pavement condition score and amount of load associated distresses was analyzed and each pavement section assigned a Weak, Moderate or Strong strength rating. The assigned structural index (30, 60 or 80 for weak, moderate and strong respectively) was not used in determining the overall pavement condition score, but simply to classify the pavement strength and aid in selecting appropriate rehabilitation strategies.

Pavement Condition Index (PCI) – Following our field surveys, the condition data is assembled to create a single score representing the overall condition of the pavement. The Pavement Condition Index (PCI) is calculated as follows:

PCI = 33% Roughness Index + 67% Surface Distress Index

Development of the pavement management plan and budgets were completed using Casper - specific rehabilitation strategies, unit rates, priorities, and pavement performance curves. The process was iterative in its attempt to obtain the greatest efficiency and cost benefit.

4.0 CASPER SURVEY PAVEMENT CONDITION

4.1 UNDERSTANDING THE PAVEMENT CONDITION INDEX

The following compares the Pavement Condition Index (PCI) to commonly used descriptive terms. Divisions between the terms are not fixed, but are meant to reflect common perceptions of condition.

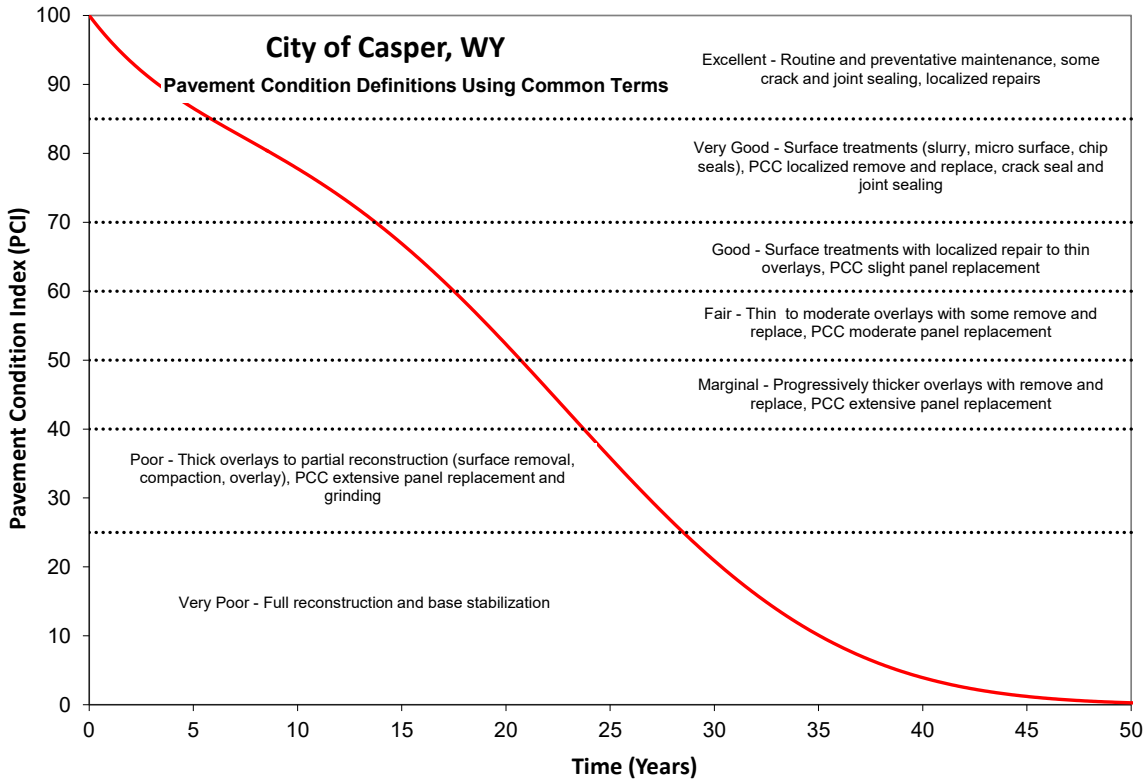

Figure 1 – Understanding the Pavement Condition Index (PCI) Score

The following table details a general description for each of these condition levels with respect to remaining life and typical rehabilitation actions:

PCI Range	Description	Relative Remaining Life	Definition
85 – 100	Excellent	15 to 25 Years	Like new condition – little to no maintenance required when new; routine maintenance such as crack and joint sealing.
70 – 85	Very Good	12 to 20 Years	Routine maintenance such as patching and crack sealing with surface treatments such as seal coats or slurries.
60 – 70	Good	10 to 15 Years	Heavier surface treatments, chip seals and thin overlays. Localized panel replacements for concrete.
40 – 60	Marginal to Fair	7 to 12 Years	Heavy surface-based inlays or overlays with localized repairs. Moderate to extensive panel replacements.
25 – 40	Poor	5 to 10 Years	Sections will require very thick overlays, surface replacement, base reconstruction, and possible subgrade stabilization.
0 – 25	Very Poor	0 to 5 Years	High percentage of full reconstruction.

4.2 CASPER NETWORK CONDITION IMAGERY

The images presented below provide a sampling of the Casper streets that fall into the various condition categories with a discussion of potential rehabilitation strategies.

Very Poor (PCI = 0 to 25) – Complete Reconstruction

Birch Street from West 15th Street to West 16th Street (GISID 2698, PCI = 23) – Rated as Very Poor, this street displays spreading base failure as evidenced by the severe alligator cracking and patching. Some of the areas where structural patches have been added are beginning to crack apart and has increase the amount of raveling on the segment. A mill and overlay on this street would not be suitable as the base has failed and would not meet an extended service life of at least 15 years. This street requires a full reconstruction and should be carefully monitored.

Deferral of reconstruction of streets rated as Very Poor will not cause a substantial decrease in pavement quality as the streets have passed the opportunity for overlay-based strategies. Due to the high cost of reconstruction, Very Poor streets are often deferred until full funding is available in favor of completing more streets that can be rehabilitated at lower costs, resulting in a greater net benefit to the City. This strategy however must be sensitive to citizen complaints forcing the street to be selected earlier. In addition, this type of street can pose a safety hazard for motorists, since severe potholes and distortions may develop. It is important to consistently monitor these streets and check for potholes or other structural deficiencies until the street is eventually rebuilt.

Poor (PCI = 25 to 40) – Last Opportunity for Surface Base Rehabilitation

Bon Avenue from East 12th Street to East 14th Street (GISID 2473, PCI = 36) – Rated as Poor, this segment still has some remaining life before it becomes a critical reconstruction need. As evident in the imagery, some of the cracked areas have been patched. On this street, the base is showing signs of failure in areas exhibiting alligator/fatigue cracking. The severely cracked areas are isolated and do not persist throughout the entire segment length and cross section. These areas should be dug out and structurally patched to attain the maximum life from any potential rehabilitation efforts. If left untreated, within a short period of time, a full reconstruction would be required.

On arterial roadways, Poor streets often require partial to full reconstruction – that is removal of the pavement surface and base down to the subgrade and rebuilding from there. On local roadways, they require removal of the pavement surface through grinding or excavation, base repairs, restoration of the curb line and drainage, and then placement of a new surface.

In general, the service life of Poor streets is such that if deferred for too long, it would require a more costly reconstruction. Streets rated as Poor are typically selected first for rehabilitation as they provide the greatest cost/benefit to the City – that is the greatest increase in life per rehabilitation dollar spent.

Marginal (PCI = 40 to 50) – Progressively Thicker Overlays

Brookview Drive from Cul-De-Sac to Navarre Road (GISID 3117, PCI = 43) – Rated as marginal with a PCI score at the lower range between Marginal and Poor streets. Marginal streets have distresses that tend to be localized and moderate in nature – that is they do not extend the full length of the segment and can be readily dug out and repaired. This street segment highlights this characteristic as the failed area does not quite extend the full length or width of the roadway and is still serviceable. However, it also highlights the relationship between base and pavement quality. Placing an overlay on this street without repairing the base would not achieve a full 15 year life as the failure would continue to occur over time. Structural patching of the failed areas along localized rehabs would permit a full width grind and inlay on this street segment and return it to full service.

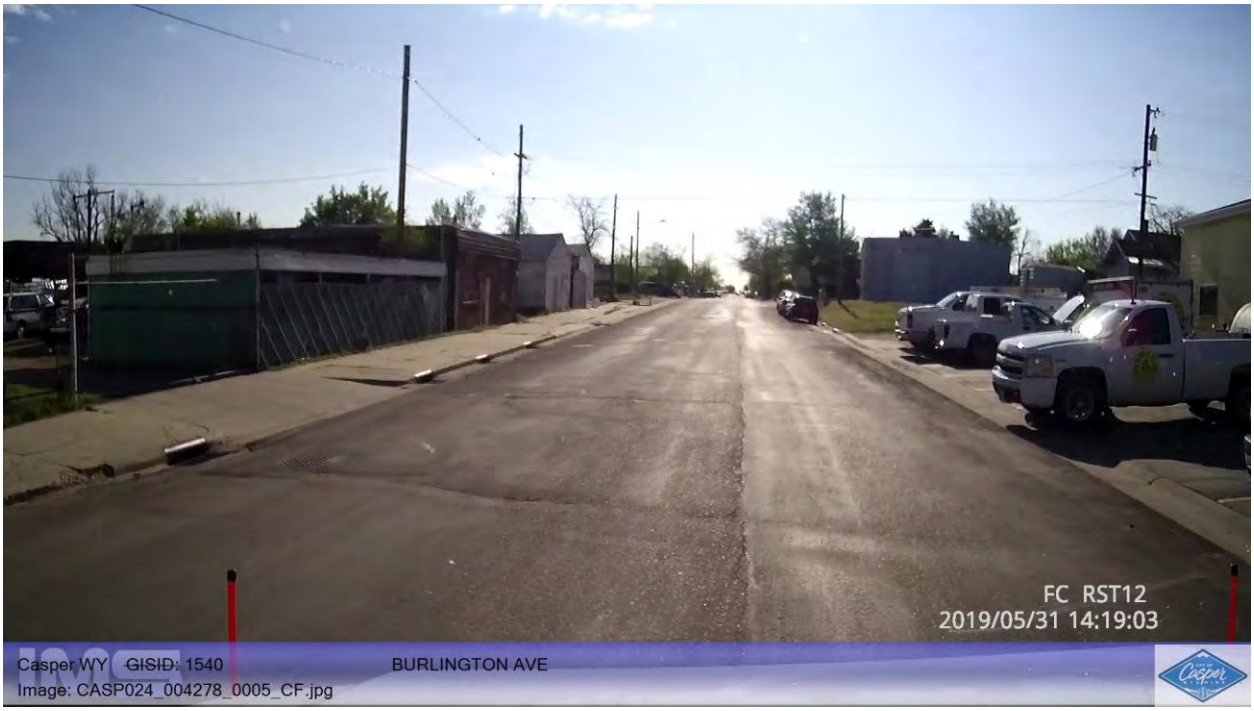
Similar to streets rated as Very Poor, Marginal streets that display high amounts of load associated distresses are selected as a priority for rehabilitation as they provide the greatest cost/benefit to the City. If left untreated, Marginal streets with high amounts of load associated distresses would deteriorate to become partial reconstruction candidates. Marginal streets that are failing due to materials issues or non-load associated failures may become suitable candidates for thick overlays if deferred, without a significant cost increase.

Fair (PCI = 50 to 60) – Thin to Moderate Overlays

Camellia from Dahlia to Honeysuckle (GISID 3509, PCI = 54) – Rated in the Fair category, these streets require thin to moderate overlays for asphalt when they enter their need year (generally within 2-3 points of the lower PCI in the defined range). Several distresses are present, but tend to be more localized and moderate in severity, and non-load related (primarily longitudinal and transverse cracking and raveling). This segment suffers from multiple instances of crack sealing that have begun to deteriorate and crack apart. The segment could benefit from a thin - medium overlay that would restore the segment to full service again. This segment is now on the steepest portion of its deterioration curve, so efforts to rehabilitate this segment should receive a higher priority.

Asphalt streets rated as Fair tend to receive a lower priority when developing a rehabilitation program. The reason for this is the cost to complete an overlay now would be on the order of $14.00 to $17.00/yd2. If deferred, the rehabilitation cost would only increase by about $3 to $5/yd2, again depending on the functional classification, in about 5 to 10 years. This delay represents a 20% difference over the time stated. Thus, the cost of deferral is low when compared to deferring a thick overlay to a reconstruction with a two to threefold increase in cost.

Good (PCI = 60 to 70) – Surface Treatments to Thin Overlays



Burlington Avenue from North Mckinley Street to North Jackson Street (GISID 1540, PCI = 63) – Rated as Good with the primary cause of deterioration the transverse and longitudinal cracking. It also displays small amounts of load associated distresses that can easily be removed to restore the visual appearance of the roadway. The existing cracks should be sealed and the pavement surface restored, with a heavier surface treatment such as microsurfacing or double slurry to fully waterproof the pavement and cover the crack sealant. The occasional dig out and replacement may be required to correct localized deficiencies. Alternatively, depending on the extent of the distressed areas, base strength and drainage, a thin overlay may be applied.

Asphalt streets rated as Good are ideal candidates for thinner surface-based rehabilitations and local repairs. Depending on the amount of localized failures, a thin edge mill and overlay, or possibly a surface treatment, would be a suitable rehabilitation strategy for streets rated as Good. Streets that fall in the high 60 - low 70 PCI range provide the greatest opportunity for extending pavement life at the lowest possible cost, thus applying the principles of the perpetual life cycle approach to pavement maintenance. The adjacent photo is a great example of a street segment (not a Casper Road) that displayed low load associated distresses and thus, high structural characteristics, and once the distressed areas were replaced, a slurry seal was applied. The patching accounted for less than 5 to 10% of the total area and resulted in a good looking, watertight final surface at a much lower cost than an overlay with less disruption to the neighborhood and curb line. The patches were paver laid and roller compacted.

Very Good (PCI = 70 to 85) – Surface Treatments and Localized Rehabilitation

Carnation from Honeysuckle to Columbine (GISID 2907, PCI = 79) – Rated as Very Good, this road displays minor amounts of NLAD primarily raveling. The surface is non-weathered, and the base is still strong. This street is an example of a candidate for preventative maintenance and light weight surface treatments to extend the life of a roadway.

Asphalt streets rated as Very Good generally need lightweight surface-based treatments such as surface seals, slurries, chip seals or microsurfacing. Routine maintenance such as crack sealing and localized repairs often precede surface treatments. The concept is to keep the cracks as waterproof as possible through crack sealing and the application of a surface treatment. By keeping water out of the base layers, the pavement life is extended without the need for thicker rehabilitations such as overlays or reconstruction. Surface treatments also tend to increase surface friction and visual appearance of the pavement surface but do not add structure or increase smoothness.

Surface treatments may include:

- *Double or single application of slurry seals (slurries are a sand and asphalt cement mix).*
- *Microsurfacing – asphalt cement and up to 3/8 sand aggregate.*
- *Chip seals and cape seals (Chip seal followed by a slurry).*

Additional cost benefits of early intervention include:

- *Less use of non-renewable resources through thinner rehabilitation strategies.*
- *Less intrusive rehabilitation and easier to maintain access during construction.*
- *Easier to maintain existing drainage patterns.*

Excellent (PCI = 85 to 100)

Columbia River Road from Quivera River Road to Indian Scout Drive (GISID 4984, PCI = 89) – Rated as Excellent, displaying little to no surface distresses. The ride is smooth and the surface is non-weathered and the base is strong. In a couple of years, this street segment would be an ideal candidate for routine maintenance activities such as crack sealant rehabilitation.

In terms of pavement management efficiency, a program based on worst-first, that is starting at the lowest rated street and working up towards the highest, does not achieve optimal expenditure of money. Generally, under this scenario, agencies can not sufficiently fund pavement rehabilitation and lose ground despite injecting large amounts of capital into the network.

The preferred basis of rehabilitation candidate selection is to examine the cost of deferral of a street, against increased life expectancy.

4.3 EVALUATING THE PAVEMENT QUALITY AND BACKLOG

The concept of the Pavement Condition Index (PCI) score, backlog percentage and number of streets rated as Excellent must be fully understood in order to understand and develop an effective pavement management program. These three metrics should fall into certain ranges in order to measure the quality and long term viability of a network.

The PCI score indicates the overall pavement condition and represents the amount of equity in the system; it is the value most commonly considered when gauging the overall quality of a roadway network. It may also be used to define a desired level of service: that is, an agency may wish to develop a pavement management program such that in five years the overall network score meets a set minimum value. Obviously, the higher the PCI score the better off the overall network condition is. Agencies with an average PCI score above 80 (when considering surface distress, roughness and possibly strength) are rare and found only in a few select communities. Less than 1 in 20 communities surveyed by IMS have that high of a condition average. Averages between 65 and 80 are indicative of either newer networks, or ones that have an ongoing pavement rehabilitation program and tend to be fully funded. Scores between 60 and 65 are common and represent a reasonable average providing a satisfactory balance between levels of service and funding, and when taken with the other two metrics may represent a well-managed and funded network. A minimum score of 60 means that overall the network falls at the lower end of the range where light weight surface treatments and thin overlays are the standard rehabilitation practice. Below a 60 means an agency has to rely on more costly rehabilitations and reconstructions to address condition issues.

At the upper end of the condition scale, a minimum of 15% of the network should be rated as Excellent. Generally, at or above 15%, means that a noticeable percentage of the roadway network is in like new condition, requiring only routine maintenance. While higher percentages of streets rated as Excellent are certainly desirable, the annual cost to maintain rates at higher multiples is often cost prohibitive. Below 15% means the agency is struggling to effectively rehabilitate their network on an annual basis. The 15% marker represents a cost effective balance between annual investment and satisfactory level of service.

Backlog roadways are those that have dropped sufficiently in quality to the point where surface based rehabilitation efforts would no longer prove to be cost effective. These roadways are rated Poor or Very Poor and will require either partial or total reconstruction. Backlog is expressed as the percentage of roads requiring reconstruction as compared to the network totals.

It is the backlog, however, that defines the amount of legacy work an agency is facing and is willing to accept in the future. It is the combination of the three metrics that presents the true picture of the condition of a roadway network, and conversely defines improvement goals.

Generally, a backlog of 10% to 15% of the overall network is considered manageable from a funding point of view with 12% being a realistic target. Fifteen percent (15%) is used as a control limit to indicate the maximum amount of backlog that can be readily managed. Backlog rates below 10%, again are certainly desirable, but financially unachievable for a large percentage of agencies. Backlogs approaching 20% or more tend to become unmanageable, unless aggressively checked through larger rehabilitation programs, and will grow at an alarming rate. At 20% a tipping point has been met and the backlog tends to increase faster than an agency's ability to reconstruct their streets.

4.4 CASPER NETWORK CONDITION DISTRIBUTION

Figure 9 presented below shows the distribution of pavement condition for the roadway network in Casper. The average PCI for the network is 59. While direct comparisons to other agencies are difficult due to variances in ratings systems, Casper is slightly below average when compared to other agencies recently surveyed by IMS, which typically fall in the 60 to 65 range.

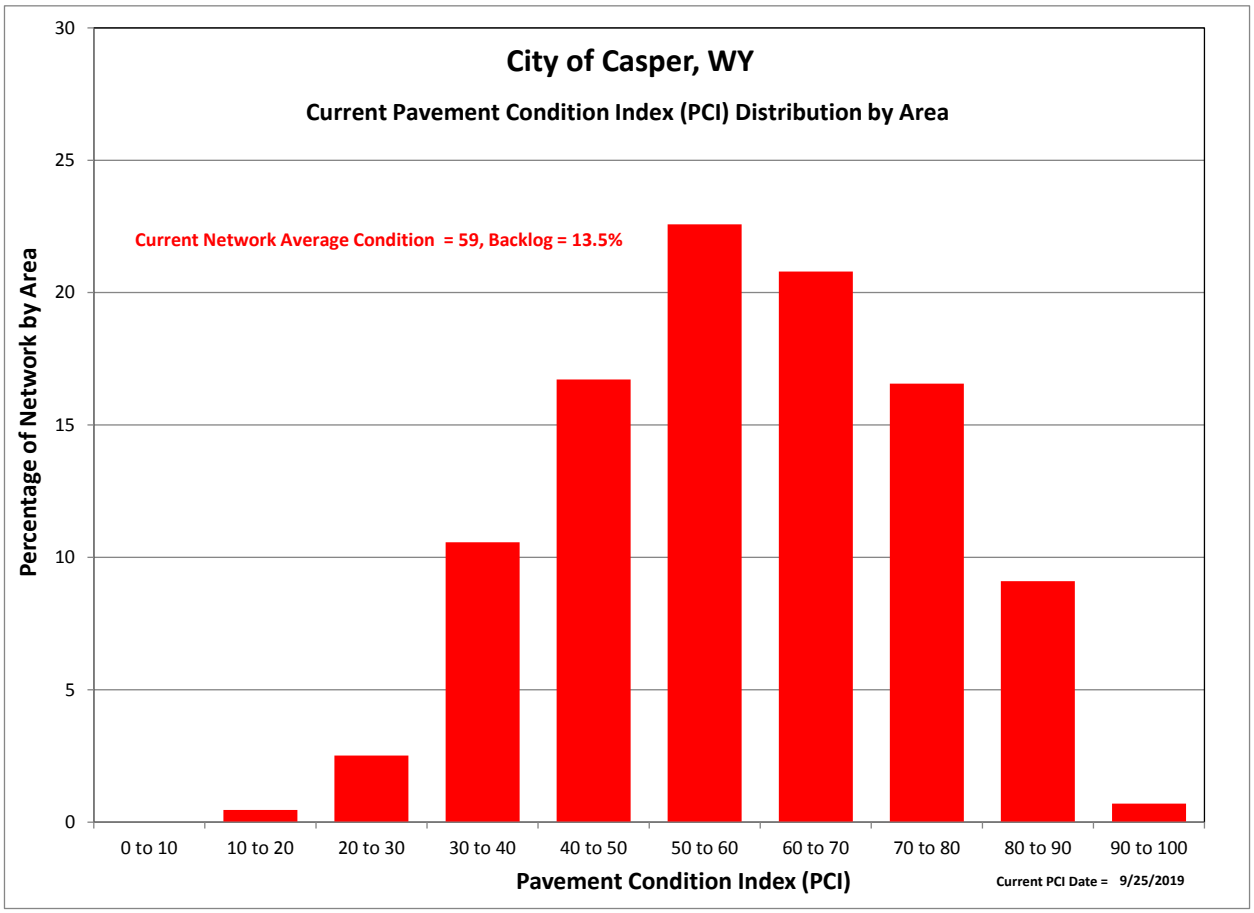


Figure 9 – Roadway Network Present Status

- This is reflective of a moderately aged network that has had some roadway renewal effort.
- Simultaneously, the City has a modest sample of streets that are approaching the end of their life where surface based rehabilitations, such as overlays, can be effective.
- Traditionally we expect to see a bell curve that is skewed to the right and centered between a PCI of 60 and 70. The Casper network curve illustrated above falls just slightly to the left of this norm and shows the need for new roadway renewal efforts.

The following graph **(Figure 10)** plots the same pavement condition information, but instead of using the actual Pavement Condition Index (PCI) value, descriptive terms are used to classify the roadways.

- Four percent (3.9%) of the network can be considered in Excellent condition and require only routine maintenance. The target value for Excellent streets should be 15%, so the Casper network fails to meet this condition.
- Twenty-three percent (22.5%) of the network falls into the Very Good classification. These are roads that benefit most from preventative maintenance techniques such as microsurfacing, slurry seals and localized panel repairs.
- Twenty-one percent (20.8%) of the streets are rated as Good and are candidates for lighter surface-based rehabilitations such as thin overlays or slight panel replacements.
- Thirty-nine percent (39.3%) of network can be considered Fair to Marginal condition representing candidates for progressively thicker overlay-based rehabilitation or panel replacements. If left untreated, they will decline rapidly into reconstruction candidates.
- The remaining fourteen percent (13.5%) of the network is rated as Poor or Very Poor, meaning these roadways have failed or are past their optimal due point for overlay or surface-based rehabilitation and may require progressively heavier or thicker forms of rehabilitation (such as extensive panel replacement, surface reconstruction or deep patch and paving) or total reconstruction.

4.5 CONDITION BY FUNCTIONAL CLASSIFICATION

Figure 13 highlights the pavement condition distribution for the arterial, collector, and local streets. Keep in mind that arterial roadways, the streets that have the majority of traffic use and link various parts of the city together, may be considered the thoroughfares of the city and during the budget development process, should receive the highest priority when selecting rehabilitation candidates.

- The **Minor Arterial Network** has an average PCI of **61**
- The **Collector Network** has an average PCI of **67**
- The **Local Network** has an average PCI of **56**
- The **State Highway** has an average PCI of **61**

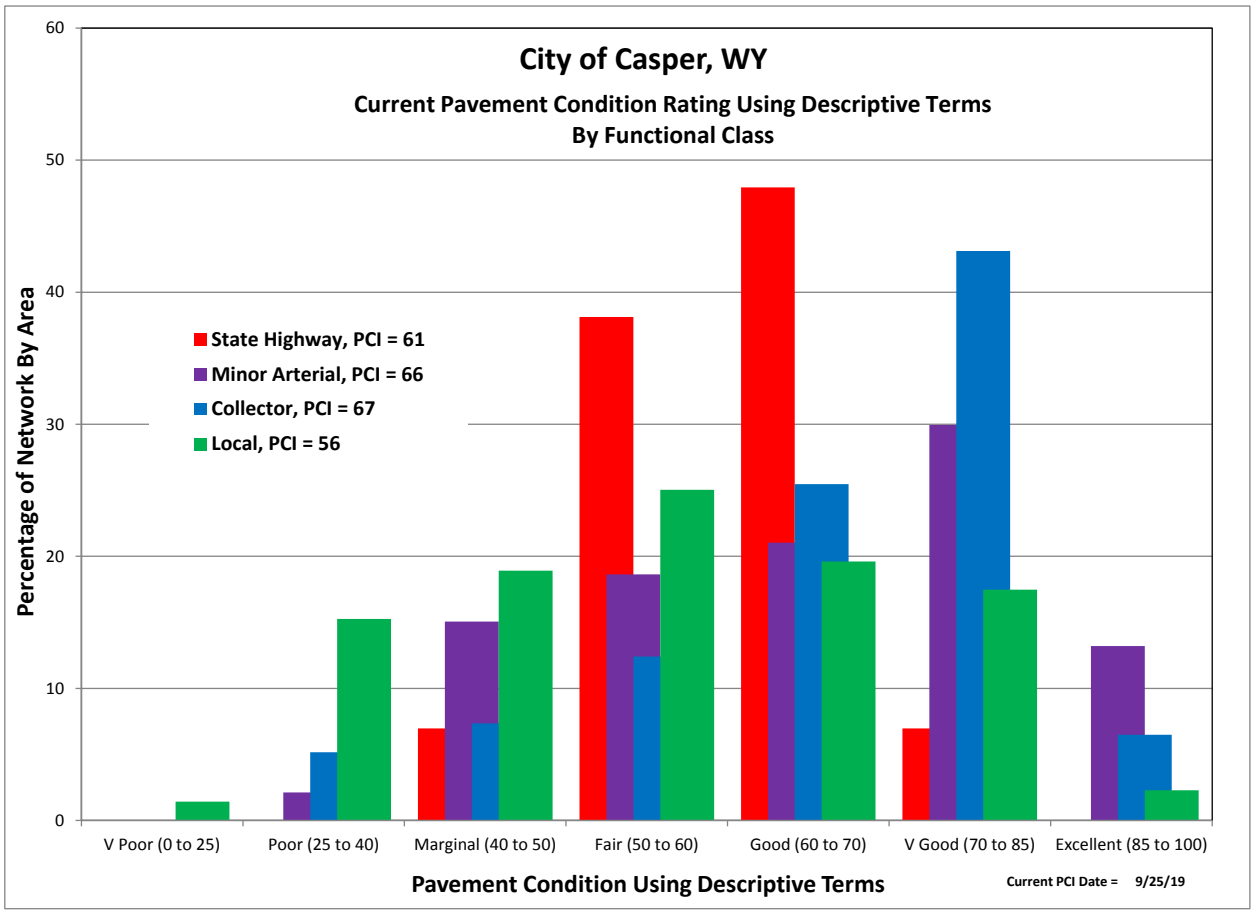

Figure 13 – Condition Rating by Functional Classification

4.6 STRUCTURAL AND LOAD ASSOCIATED DISTRESS ANALYSIS

Structural testing and analysis was not performed for the City of Casper. Instead, analysis of the cause of pavement failure for these street segments was completed by examining the types of distresses that have caused the PCI score to drop.

Surface distresses may be categorized into two classifications – load associated distresses (LADD) and non-load associated distresses (NLAD). Load associated distresses are those that are directly related to traffic loading and structural capacity. Non-load associated distresses are those that result from materials or environmental issues including shrinkage (transverse) cracking, bleeding and raveling. Generally, load associated distresses affect the overall condition score more than non-load associated distresses – as is the case in Casper. For asphalt streets, roadways were classified as Weak, Moderate, or Strong.

The purpose of the structural analysis is twofold:

- The structural analysis provides input into which performance curve each segment is to use – performance curves are used to predict pavement deterioration over time.
- Structural analysis assists in rehabilitation selection by constraining inadequate pavement sections from receiving too light of a rehabilitation and conversely, identifying segments suitable for lighter weight treatment.

Figure 14 plots the relationship of the load associated distresses (shown in red) against pavement condition. As can be seen from the plot, at higher PCI scores, most pavements fall into the moderate strength classification as the distresses have not yet begun to manifest themselves into severe failures. As the PCI score drops, the load associated distresses typically affect the PCI score to a higher degree with more segments being classified as weak. Conversely, segments that have a declining PCI score and low LADD, are classified as strong as they display few load associated failures. High PCI score (above 60) rehab selections should focus on pavement preservation activities such as surface treatments or thin overlays, possibly with some localized pavement repairs and crack sealing.

The sum of the Load-Associated Distress deducts (LADD) is also used to qualify the appropriate rehabilitation strategy selection in addition to the overall pavement condition score. For example, a street that has a good PCI score (that is between 60 and 70) and is displaying relatively low load associated distress deducts would be a suitable candidate for a surface treatment in place of a thin overlay in that the PCI score is more influenced by materials issues such as transverse cracking or raveling.

Overall, the low amounts of streets exhibiting weak performance can generally be attributed to poor subgrade conditions, insufficient pavement thickness and increased traffic loading – in particular heavy, side-loading garbage and recycling trucks (an unintended consequence of green initiatives) along with school buses and delivery vehicles. The average weight of these vehicles coupled with tire pressure and configuration today compared to those from a few decades ago has increased drastically.

- The upper black diagonal line identifies segments that have a high ratio of load associated distresses compared to their PCI score. These segments are classified as weak.
- The lower black diagonal line identifies segments that have a low ratio of load associated distresses compared to their PCI score and are classified as strong.
- Segments that fall between the two lines are assigned a moderate pavement strength.

The sum of the Load-Associated Distress deducts (LADD) is also used to qualify the appropriate rehabilitation strategy selection in addition to the overall pavement condition score.

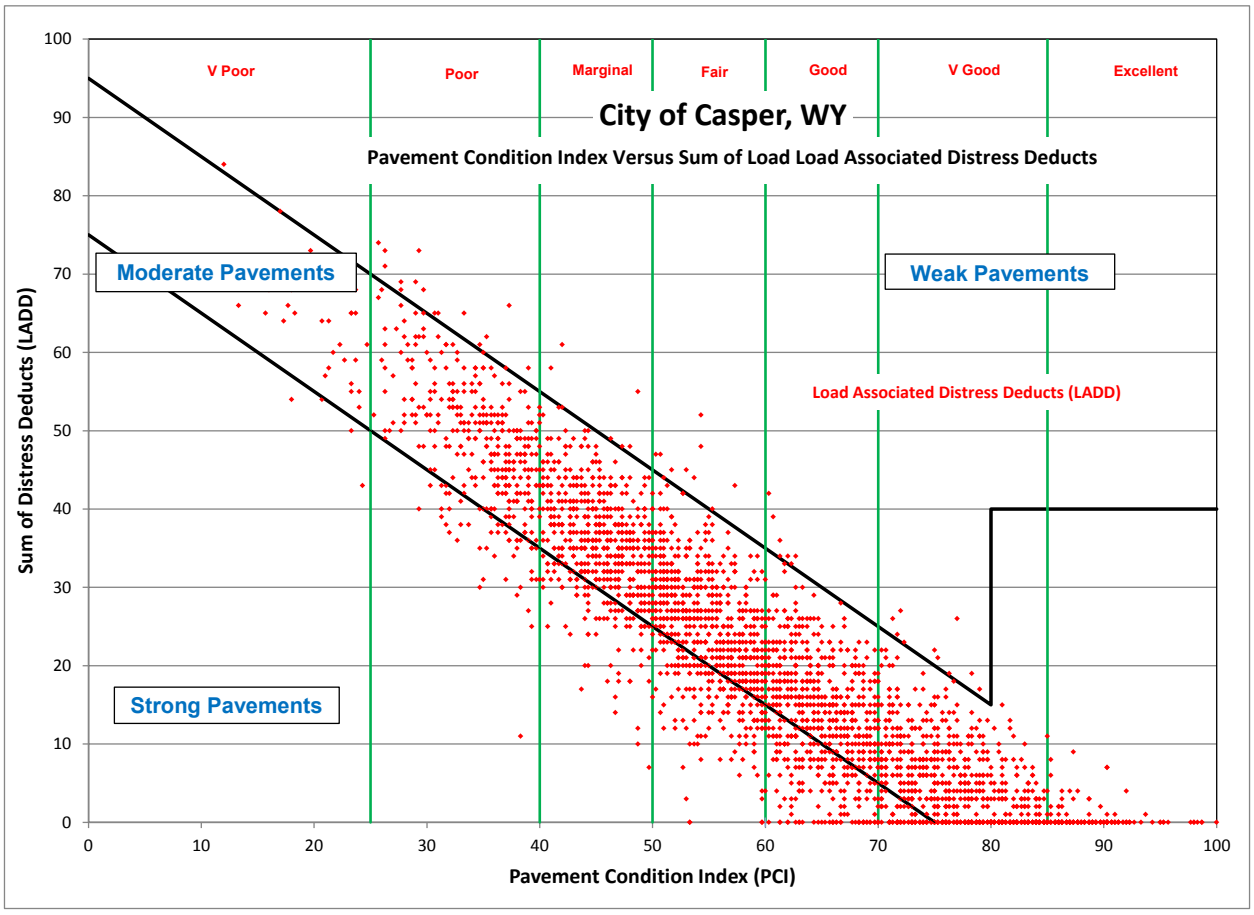

Figure 14 – Pavement Condition Index versus Sum of Distress Deducts

5.0 REHABILITATION PLAN AND BUDGET DEVELOPMENT

5.1 KEY ANALYSIS SET POINTS AND PAVEMENT PERFORMANCE CURVES

Pavement management analysis requires user inputs in order to complete its condition forecasting and prioritization. A series of operating parameters were developed in order to create an efficient program that is tailored to the City's needs.

Some of the highlights include:

- The pavement performance curves that are used to predict future pavement condition. Asphalt streets are classified as weak, moderate, or strong, and then assigned the appropriate pavement performance curve based on their functional classification to use in the analysis. The concept of load associated distresses does not apply to concrete streets.
- The shape of performance curves reflect the concept of deferred maintenance and salvage life. Instead of dropping to an absolute PCI value of 0 after 40 years of service, the curves are designed to become asymptotic to the age axis and have a whole life of approximately 50 to 60 years depending on pavement type. This indicates the notion that once a street deteriorates past a specific threshold – about a PCI of 20, age becomes less important in rehab selection.
- Priority ranking analysis uses prioritization for rehabilitation candidate selection. It is designed to capture as many segments in their need year based on the incremental cost of deferral. The higher the functional classification of a street, the higher priority a segment is given.

Rehabilitation Strategies and Unit Rates

The rehab strategies and unit rates used in the pavement analysis can be found on the following page. Some important parameters include:

- **Rehab Code and Activity** – The assigned identifier and name to each rehabilitation strategy. The relative terms of thin, moderate and thick are used to describe the overlay thickness. This is to facilitate consistency in the naming convention, but does not imply the same material thickness has to be used for each functional classification.

  The recommended rehab activities for any given PCI range may vary due to pavement strength and functional classification. For example, an arterial between a PCI of 50 to 60 may receive a thin to moderate overlay, while a local access road may only receive a chip seal or thin overlay.

- **Unit Rates** – The rehab costs are presented on a per square yard basis for each pavement type, functional class, and rehabilitation activity combination. The rates were developed using typical national averages for similar activities and adjusted for Casper's location and unique conditions. An additional burden to all costs was also added to cover City overheads, design and engineering and inspection. Costs for peripheral concrete rehab (valley gutters, inlets, approaches, etc.) have not been included in the analysis.

The unit rates are reflected in the network value, final budgets, and average cost/mile for doing work in Casper.

**Unit rates vary slightly between functional classes*

Min PCI, Critical PCI, and Max PCI – These define the Pavement Condition Index (PCI) range applicable to the rehab selection. The Critical PCI defines when a segment is in its need year and is deemed to be critical, otherwise if deferred, the street declines in PCI past the point which the rehabilitation is no longer appropriate. Generally the Critical PCI falls 2 to 4 points higher than the minimum PCI applicable for each rehab activity.

Figure 16 graphically presents the application of pavement rehabilitations for asphalt streets by PCI. The Rehab numbers are simply placeholders that separate each rehabilitation project identified on the chart above. For example, Rehab 43 is a Moderate Overlay + Structural Patch. EM/FWM is an abbreviation for Edge Mill/Full Width Mill and RR is short for remove and replace (structural patching).

Unit rates increase slightly between functional classes to reflect increase costs in pavement thickness, traffic control, and striping.

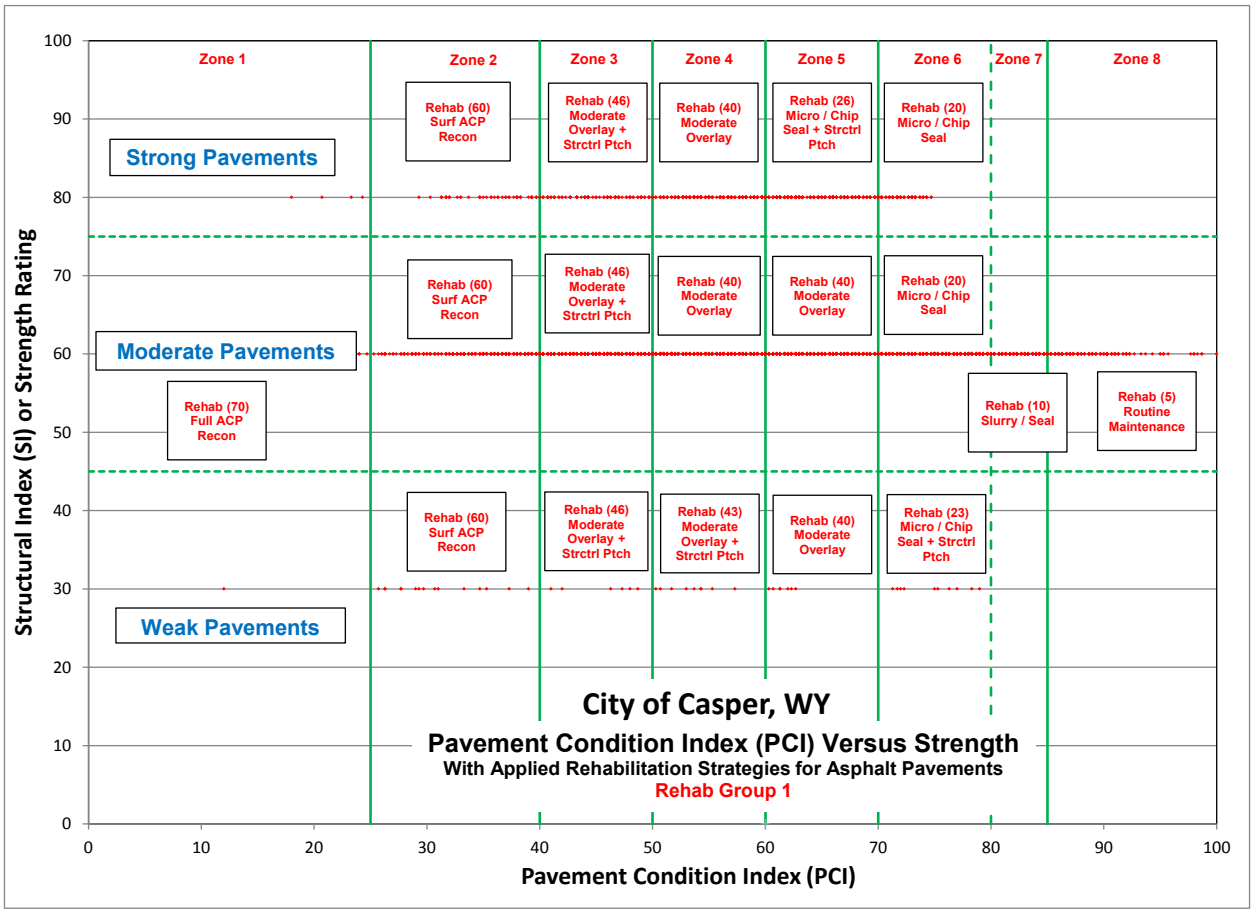

Figure 15 – Asphalt (ACP) Rehabilitation Strategies

Selection and Prioritization of Rehab Candidates

The City's pavement management program incorporates a series of user defined values to prioritize and select the street segments for rehabilitation. The rehab selection order is not worst first, but rather designed to capture as many segments in their need year based on the incremental cost of rehab deferral. A Street is considered to be in its need year when it has reached its maximum service life and any further deferral would require a heavier and more costly rehabilitation. The rehab program has been designed to maximize the increased service life for each rehabilitation dollar spent on a segment.

Other factors included in the prioritization process focus on:

- **Need Year** – streets are only selected when they have expended their service life and are optimal for rehab selection.

- **Functional Classification** – generally priority is given to higher functional classifications as they provide greater benefits to a larger group of users
- **Pavement Strength** – weaker streets are prioritized higher than stronger ones as they deteriorate faster.
- **Area** – a very slight increase in priority is given to larger projects over smaller ones.

The net result is a program that favors thick overlays, followed by partial reconstruction projects then full reconstruction projects (more for safety reasons than cost-benefit). These are then followed by surface treatments and lastly by moderate to thin overlays.

The programmed deterioration curves illustrated in **Figure 16** are designed to integrate the pavement condition distribution performance curves for the network, with the applied rehabilitation strategies and their expected life cycle. Different color performance curves are meant to represent the full suite of curves assigned to segments based upon their functional class, pavement type, and strength.

It is important to recognize that even though all streets fall into specific rating categories and their respective rehabilitation strategies, it is not until a street falls to within a few points of the lower end of the range that it will become a critical need selected for rehabilitation.

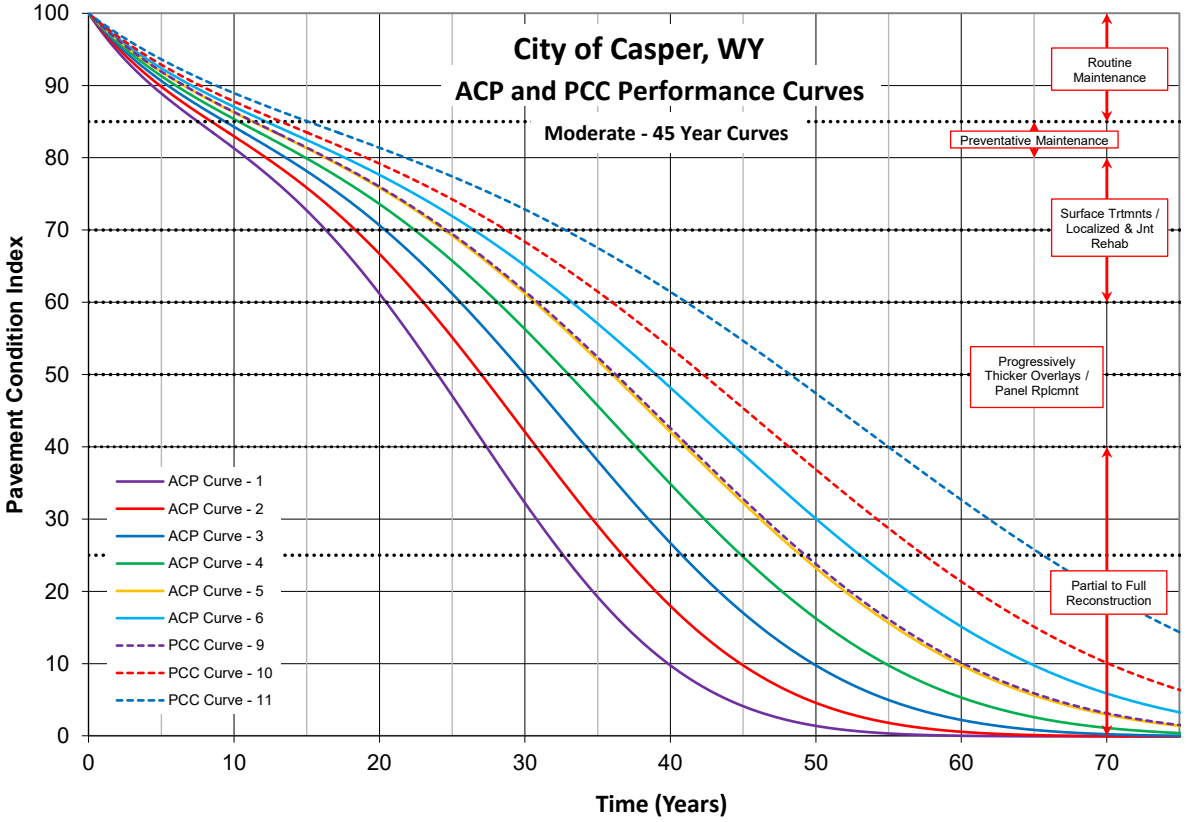

Figure 16 - Performance Curves

5.2 FIX ALL AND ANNUAL ESTIMATES

Three different approaches may be taken to identify and confirm the amount of funds the City needs to set aside each year to maintain the roadway network at its current condition. All three are completed externally to the pavement management system and are simply used to validate the final results.

Option 1 – Estimated Life Cycle Cost Based on Network Value

An approximate value for the annual street maintenance budget may be quickly determined by taking the total value of Casper's roadway network, estimated at $555M, and dividing that by the ultimate life of a roadway – approximated to be 50 years for asphalt and 75 years for concrete. By this method, the annual budget is estimated at $10,921,000.

Please note, the 50 to 75 year lifespan of the roadway is the theoretical life of the roadway surface from construction, until the point at which there not usable surface remaining, it is not simply the lifespan of the pavement surface until the next overlay.

Rehabilitation Estimate Based on Network Valuation

Pavement Type	Network Valuation ($)	Ultimate Life Span (yrs)	Life Cycle Cost ($/Yr)
Asphalt Network	528,142,000	50	10,563,000
Concrete Network	26,880,000	75	358,000
City of Casper, WY Network Totals:	**555,022,000**		**10,921,000**

Option 2 – Estimated Life Cycle Cost Based on Current Condition

A second method to validate the annual budget is to identify the average network PCI and associated rehabilitation requirements, and then estimate the number of miles required to be rehabilitated each year based on a typical life cycle for that rehabilitation activity. For Casper, the average PCI for asphalt roads is 58, which places the Casper asphalt network in the EM/FWM + Moderate Overlay, at an average cost of $14.27/yd^2. Based on this estimate the City needs to spend approximately $3,297,742/year to maintain the current condition average.

Rehabilitation Estimate Based on Network Average Condition

Pavement Type	Pavement Condition Index (PCI)	Rehab Code	Rehab Activity	Average Rehab Life Cycle (Yrs)	Miles to do Each Year	Blended Unit Rate ($/yd2)	Average Cost per Mile ($/)	Life Cycle Cost ($/Yr)
Asphalt Network	58	40	EM/FWM + Moderate Overlay (2.0 - 3.0)	28	10.0	14.27	312,000	3,104,487
Concrete Network	69	530	PCC Slight Pnl Rplcmnt (<10%)	31	0.2	32.00	894,900	193,255
City of Casper, WY Network Totals:								**3,297,742**

Option 3 – Estimated Life Cycle Cost Based on Network Deficiency

The third methodology to confirm the required amount of annual funding is to identify the current network deficiency, that is the amount required to rehabilitate all streets in the network assuming unlimited funding, and then divide by the typical life cycle of each rehabilitation activity. This is referred to as the Fix All Estimate and Life Cycle Cost. The rehab strategies listed in the table are generic in nature and not necessarily the final set that was applied to Casper. For Casper, the Fix All Estimate for the network deficiency is approximately $116.9M and the Life Cycle Cost is $4.5M/year, broken down as follows:

City of Casper, WY

Rehabilitation Estimate Based on Current Network Deficiency and Life Cycle Cost

Rehab Code	Rehab Activity	Network Total ($)	% of Total	State Highway	Minor Arterial	Collector	Local	Life Cycle (Yrs)	Life Cycle Cost ($/Yr)
10	Slurry Seal / Seal Coat	1,223,400	1.1	0	317,160	304,220	602,050	5	244,700
20	MicroSurface / Chip Seal	5,602,300	5.0	0	286,050	2,058,430	3,257,800	8	700,300
23	MicroSurface / Chip Seal + Strctrl Ptch	0	0.0	0	0	0	0	8	0

5.3 NETWORK BUDGET ANALYSIS MODELS

An analysis containing a total of 10 profile budget runs plus a Do Nothing options was prepared for Casper.

The analysis results are summarized below:

- **Do Nothing** (illustrated in Figure 20) – This option identifies the effect of spending no capital for 5 years. After 5 years, this scenario results in a network average PCI drop from a 59 to a 50 and a dramatic increase in backlog to 30.5%
- **Casper Budget** (Green Line) – this represents the City's current annual budget of $3.7M annually dedicated to pavement preservation and rehabilitation. This level of funding will result in a network average PCI score of 54 and a backlog of 25%.
- **Steady State PCI** – this is simply the funds required to maintain the current network average PCI at a 59. The annual budget required to do so is on the order of $6.6M annually, however backlog (Very Poor & Poor roadways) continues to climb to 18% from its current 13.5%
- **PCI control budget** – the funding needed to maintain a PCI of 60 is on the order of 7.5M annually.
- **Backlog control budget** – A budget designed to maintain the City's backlog at or below 17%.

The results of the analysis are summarized in **Figure 17** below. The X-axis highlights the annual budget, while the Y-axis plots the 5 Year Post Rehab Network Average PCI value. The diagonal blue line is the results of the pavement analysis (the Casper model profile).

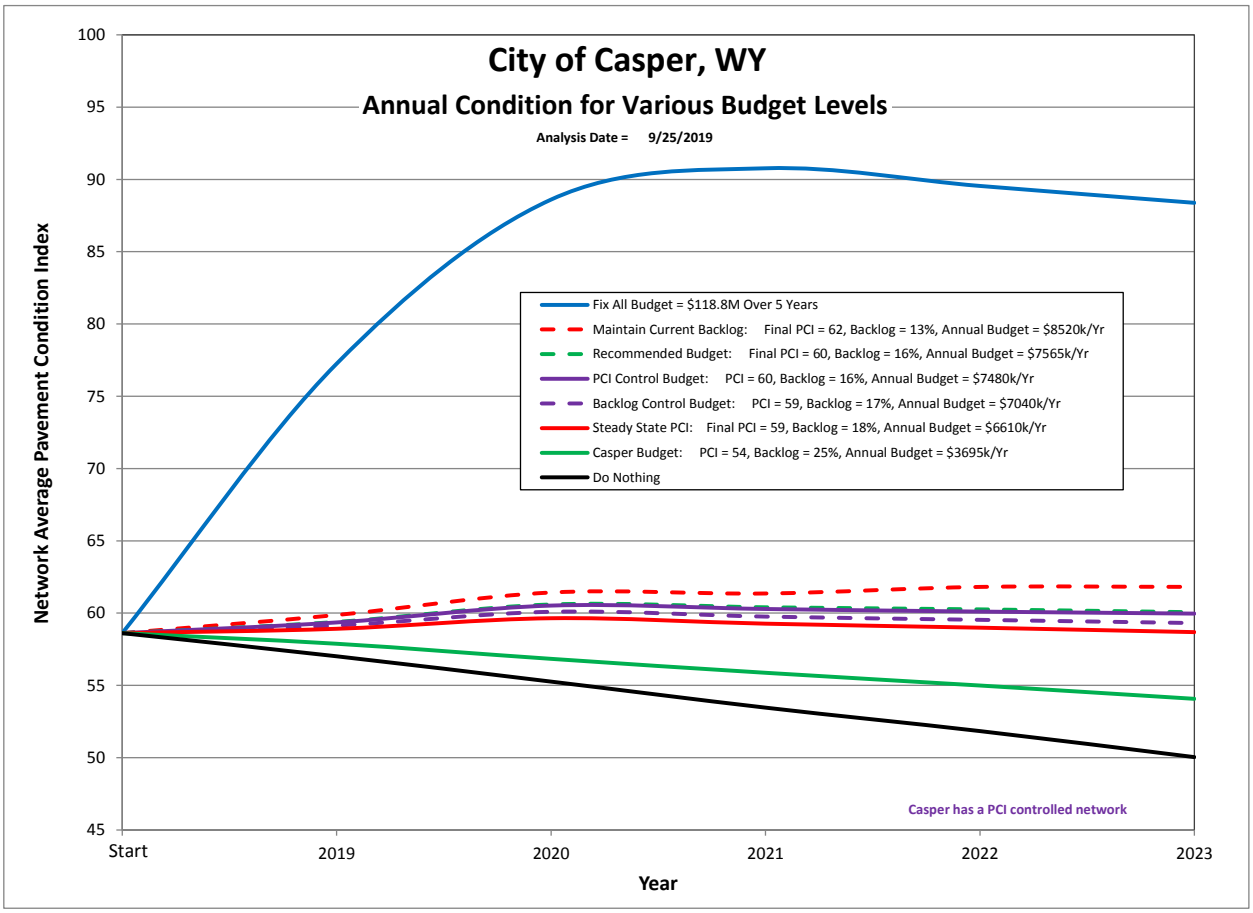

Figure 17 – 5 Year Post Rehab Network PCI Analysis Results

Figure 18 presents the resultant network backlog against annual budget. Similar to Figure 17, but instead of plotting the average PCI score, the blue diagonal line represents the total backlog after 5 years.

The lower the backlog the better, with a maximum of 12% recommended

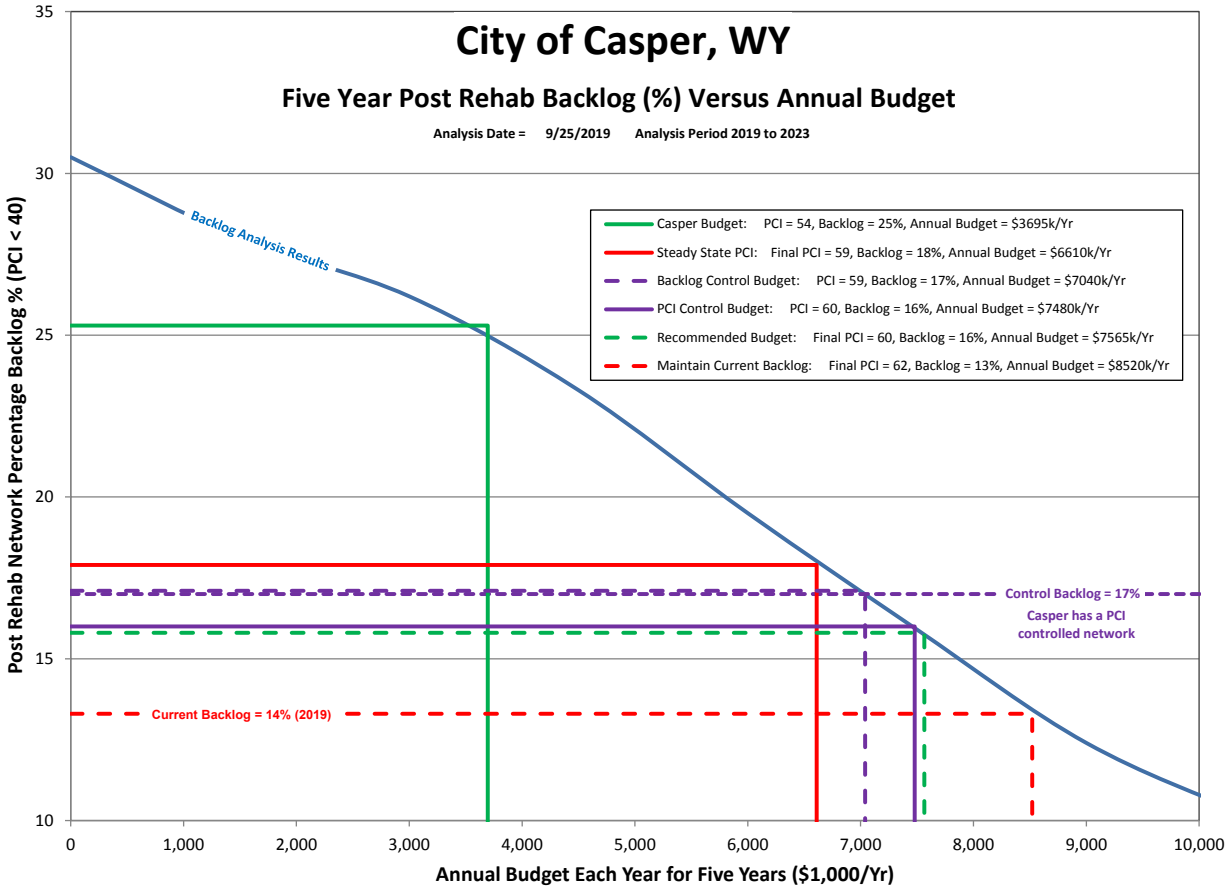

Figure 18 – 5 Year Post Rehab Network Backlog Results

Figure 20 presents the analysis results on an annual basis. This shows that if the budget falls below $6.6M/year (Steady State Budget), over time the overall condition of the roads will deteriorate as backlog continues to grow.

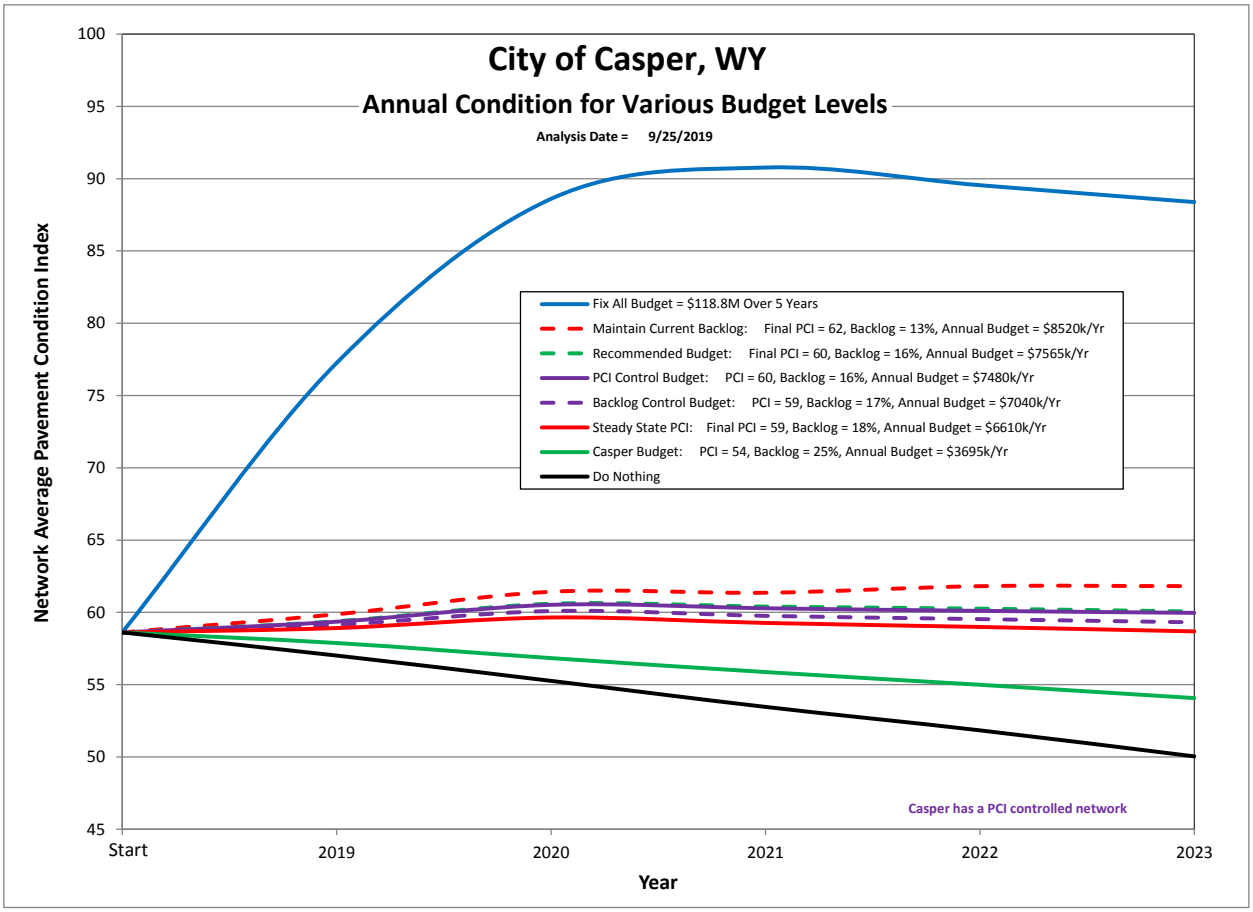

Figure 19– 5 Year Annual PCI

5.4 POST REHABILITATION CONDITION

The following figure (**Figure 21**) compares the current network condition distribution (red) against what the 5-year post rehabilitation distribution would be at with the current budget of 3.7M/year (green). As can be seen in the plot, the Casper budget will reduce the overall network's PCI average and increase the amount of roads rated as poor and very poor.

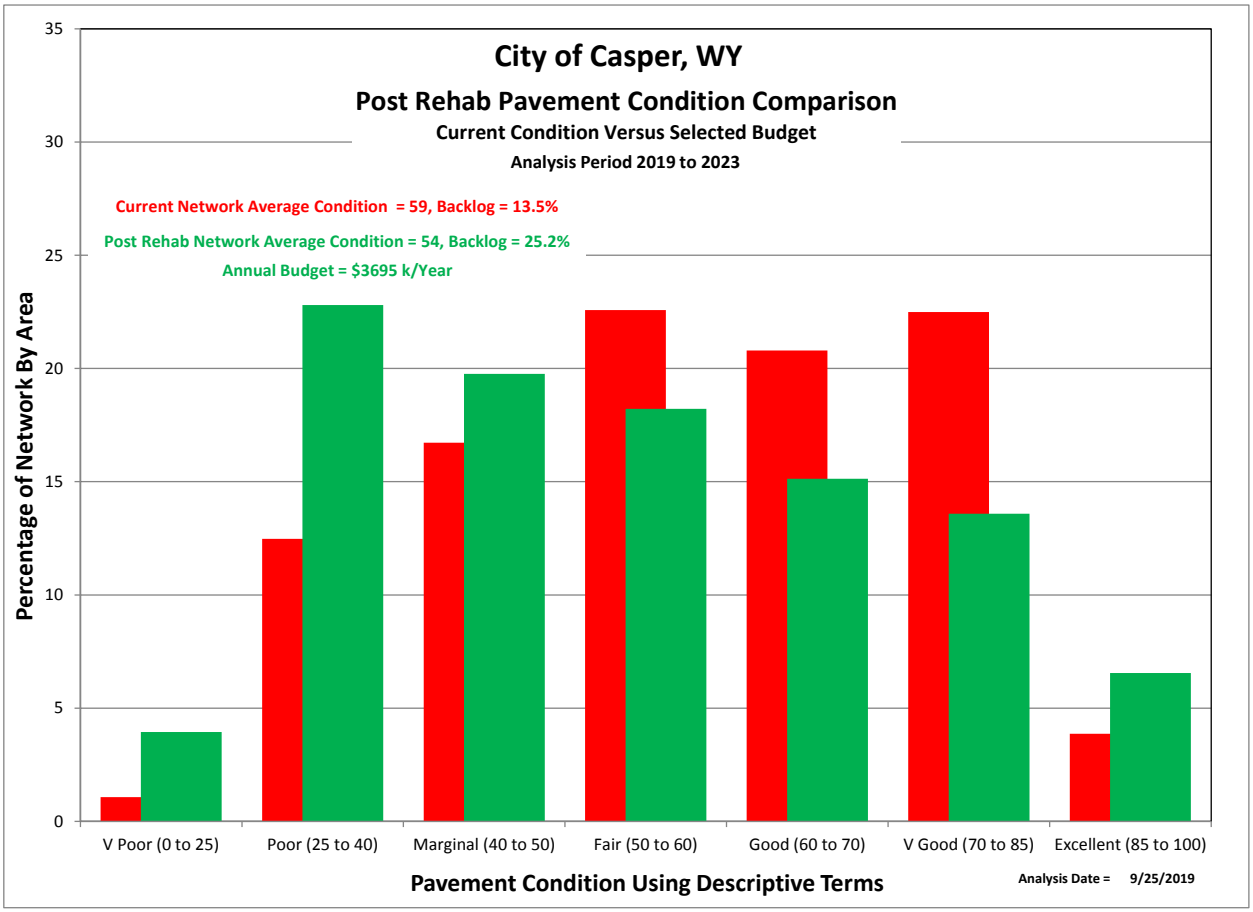

Figure 20 – Five-Year Post Rehabilitation Condition Distribution

Three metrics are used to evaluate the quality of a roadway network, they are:

Average Condition – should be between 60 and 65 at a minimum
Percentage of Backlog – target 12%, should be less than 15%, must be less than 20%
Percentage of Streets Rated as Excellent – should be greater than 15%

5.6 TRUE COST OF UNDERFUNDING OF A ROADWAY NETWORK

Funding of roadway rehabilitation is an exercise in identifying the balance between available funding and the desired level of service that is right for each agency. There are no hard rules for what is the definitive level of funding as this is a decision for local elected officials, based on their priorities and practices.

However, the true costs of over and underfunding must be presented in order to provide decision makers with all the information available to base the decisions upon. Casper has a considerable investment in their paved roadway network with a combined replacement value (just for the streets, not right of way) exceeding $555M. Spreading this cost over a 50 to 100 year period (the expected ultimate life of a roadway) means that an annual investment on the order of $6.6M per year would be required – not including the cost of maintenance, deterioration ,repair curbing, drainage, tree roots, sidewalks or ADA ramps.

Government Accounting Standards Board Statement 34 requires that agencies who collect taxes (local, business, property or gas taxes) for the purpose of maintaining long term infrastructure assets (such as roads) be good stewards of those assets by either accounting for them financially on the City's balance sheet, or implement a methodology to manage and fund them to a locally defined level of service.

The condition of a roadway network may be equated to equity in a depreciating asset. Regular payments to that asset must be made in order to maintain the equity at a constant level. Should those payments fall short, the equity must eventually be replaced through a large influx of capital in order to make the investment whole again. Roadway networks are no different. Long term underfunding of rehabilitation and maintenance is the direct equivalent of removing equity from an asset – eventually it must be repaid through total reconstruction. The following table compares the real cost of the various budgets against the Do Nothing and Steady State options.

City of Casper, WY
Equity Removal Summary

Starting PCI:	59
Five Year Post Rehab Fix All PCI:	88
Fix All PCI Increase:	29
Five Year Fix All Total Cost ($):	118,797,000

5.7 NETWORK RECOMMENDATIONS AND COMMENTS

The following recommendations are presented to Casper as an output from the pavement analysis, and must be read in conjunction with the attached reports.

1. Casper should adopt a policy statement to maintain PCI at or above a 75 while keeping backlog below 10%.

   An annual budget of $3.7M (dedicated to pavement rehabilitation) will achieve a network average PCI of 54 and backlog of 25%.

2. The full suite of proposed rehabilitation strategies and unit rates should be reviewed annually as these can have considerable effects on the final program.

3. No allowance has been made for network growth. As the City expands or increases the amount of paved roads, increased budgets will be required.

4. No allowance has been made for routine maintenance activities such as asphalt crack sealing, pothole filling, sweeping, striping or patching within the budget runs and analysis. These costs are assumed to be outside the pavement management costs.

5. The City should resurvey their streets every few years to update the condition data and rehabilitation program.

MEMO TO: J. Carter Napier, City Manager

FROM: Andrew B. Beamer, P.E., Public Services Director

SUBJECT: Request from the Natrona County School District to Vacate West 8th Street from South David Street to South Center Street

Meeting Type & Date:
Council Work Session
February 25, 2020

Action Type
Information

Summary:
The Natrona County School District is in the process of remodeling Park Elementary School at 140 West 9th Street. Their project includes a small addition as well as improvements around the site. To provide additional staff parking and more flexibility with bus operations, the school district is requesting that West 8th Street, immediately north of the school, be vacated from South David Street to South Center Street.

The City of Casper has a sanitary sewer main within this stretch of roadway that only serves Park Elementary. If Council grants the school district's vacation request, the school district has agreed to assume ownership and maintenance of this sewer line.

Doug Tunison, the project manager for the school district, will be available at the work session to answer any questions.

Financial Considerations:
None

NATRONA COUNTY SCHOOLS

February 21, 2020

MEMO: His Honor, Mayor Freel; City Council Members; J. Carter Napier, City Manager

From: Sydney P. Webb, Director of Transportation, Natrona County School District

Subject: Student Transportation

Meeting Date: February 24, 2020

Recommendation:

City of Casper collaborate with NCSD Student Transportation regarding future growth of Casper to ensure smooth operations for all concerned while minimizing impact to traffic flow and maximizing time of snow removal efforts during times of inclement weather.

Summary:

NCSD transports approximately 2500 students twice a day utilizing a central Hub System. In addition, 300 students are transported using a curb to curb service. The implementation of the Hub in 2014 resulted in a removal of an astounding 293,000 miles travelled per year. Additionally, the Hub system allowed NCSD to remove 622 duplicated stops resulting in decreased travel time for most students. NCSD strives to be efficient and effective with all our processes.

With this focus, NCSD transportation is analyzing student routes to correlate with the city's priority snowplow routes. Aligning student transportation with the priority snowplow routes will enhance service on the high impact inclement weather days, ensure safety for our drivers and riders, and assist in punctual arrival and departure times. Punctuality effects our entire community: if the bus is running behind, parents and caregivers run behind. It is in the best interest of the entire community that we transport students in a timely and safely manner.

NATRONA COUNTY SCHOOLS

NCSD Student Transportation will continue to evaluate stops to ensure that safety is its number one concern. In doing so, all stops including internal neighborhood stops will be analyzed to see if a relocation to an outer priority route would provide increased benefit for safety, ease of traffic flow, and efficiency on inclement weather days.

NCSD Student Transportation would ask that as the City of Casper grows and new construction takes place, that the city would consider creating safe loading and unloading areas in the form of curb pullouts similar to what is seen at some of the schools and the Bus Hub on Center Street. These areas would be beneficial not only for the Student Transportation but also for the city bus system. With The Bus having 6 routes and 79 stops almost hourly, these pullouts will increase traffic flow and pedestrian safety all over the city. We believe that collaborating transportation needs within the city is a wise use of public resources.

February 13, 2020

MEMO TO: J. Carter Napier, City Manager

FROM: Tom Pitlick, Financial Services Director

SUBJECT: Amendment to the Fiscal Year 2020 Budget

Meeting Type & Date:
Council Work Session
February 25, 2020

Action type:
Information Only

Recommendation:
Move Forward For Approval

Summary:
The Municipal Budget Act, Section 16-4-108, prohibits the expenditure or encumbrance of any money in excess of the amounts provided in the budget for each department. To comply with this requirement, City Council may authorize an adjustment of budgets.

The budget amendment being proposed would be the second amendment to the originally adopted Fiscal Year 2019-2020 budget. If approved, this amendment would add $14,289,380 of expenditure authority to the current budget. Of this amount, $8,399,495 would be offset by various funding sources including grants, transfers, and reimbursements. The remaining $5,889,886 would need to be covered through the use of unassigned cash from the various funds.

Financial Considerations:

The net impact to the Fiscal Year 2019-2020 annual budget would be $5,889,886 as summarized below:

General Fund	$ 317,670
Perpetual Care	$ 1,705,184 (Ice Arena Chiller)
Local Assessment District	$ 1,612,870 (Project SAFE)
Metro Animal Shelter	$ (21,910)
Revolving Land Fund	$ 980,573 ($954,436 toward Project SAFE)
Police Grants	$ -0-
Transit Fund (CATC)	$ -0-
PSCC Fund	$ 202,500 (light equipment purchases)
Capital Fund	$ 943,452 (1st Street Change Order; Project SAFE, PD station fy '19 budget carry forward)
Water Fund	$ (114,356)

Sewer Fund	$ 114,356
Refuse Fund	$ 13,826
Balefill Fund	$ 10,721
Golf Fund	$ 125,000 (19th Hole refurbish)

A detailed listing of the budget adjustments is attached.

Oversight/Project Responsibility:
Tom Pitlick, Financial Services Director

February 19, 2020

MEMO TO: J. Carter Napier, City Manager

FROM: Liz Becher, Community Development Director
Craig Collins, AICP, City Planner

SUBJECT: Gaming/Gambling in the C-4 (Highway Business) zoning district

Meeting Type & Date:
Council Work Session, February 25, 2020

Action Type:
Direction requested

Summary:
The City has been approached by a purveyor of a Pari-Mutuel wagering business that is proposing to locate a gaming/gambling establishment at the old Sidelines/Altitude building located at 1121 Wilkins Circle. The property is located within the North Platte Industrial Park, and is zoned C-4 (Highway Business). Gaming/Gambling is listed as a Conditional Use Permit in the C-4 zoning district, requiring the approval by the Planning and Zoning Commission. However, there is a limitation in the Municipal Code that prevents the approval of a Conditional Use Permit for gaming/gambling in the C-4 district when the property is located within three hundred feet (300) of a school or church. In this case, there is a church located directly adjacent to the property, at 1101 Wilkins Circle.

In 2017 the City was approached by the Executive Director of the Pet Ring Foundation who wanted to operate a gaming/gambling establishment at the old Godfather's Pizza building on East Second Street. He was initially prevented from operating a gaming/gambling establishment at the location because it was located within 300' of a church, which prevented the issuance of a Conditional Use Permit. After reviewing the Municipal Code at a work session, City Council directed staff to draft a Municipal Code text amendment to make gaming/gambling a permitted use, by right, in the C-2 zoning district, and to remove the proximity limitations regarding schools and churches, using the justification that it could not be adequately explained what negative land-use implications resulted from locating gaming/gambling establishments next to churches and schools, and that potential land-use conflicts were actually less likely than with other businesses, such as bars and liquor stores, that were already permitted and had no such limitations.

In that C-4 (Highway Business) is a more intensive commercial zoning classification than the C-2 (General Business) zoning district, a similar Municipal Code text amendment is being proposed for Council's consideration. It is noted that the historical use of the subject property

was for a bar/liquor establishment, which had no separation requirement from the adjacent church. Should the Council direct staff to proceed with a Municipal Code text amendment to allow gaming/gambling in a C-4 (Highway Business) zoning district, without location limitations, the first step will be the review of the amendment by the Planning and Zoning Commission at either its March or April public hearings. After Planning and Zoning Commission review, the amendment would proceed to Council for approval by ordinance, with final approval anticipated for late May.

Financial Considerations:
The City of Casper receives revenue from Pari-Mutuel wagering establishments located within its jurisdiction, per State law.

Oversight/Project Responsibility:
Community Development Department will process any Municipal Code text amendment directed by Council

Attachments:
DRAFT Ordinance

ORDINANCE NO. ____

AN ORDINANCE AMENDING CHAPTER 17.68 OF THE CASPER MUNICIPAL CODE, PERTAINING TO GAMING/GAMBLING IN THE C-2 (GENERAL BUSINESS) ZONING DISTRICT.

NOW, THEREFORE, BE IT ORDAINED BY THE GOVERNING BODY OF THE CITY OF CASPER, WYOMING:

SECTION 1:

That Section 17.76.020 of the Casper Municipal Code is hereby amended to add "Gaming/Gambling," alphabetically, as a permitted use in the C-4 (Highway Business) zoning district, and renumber the section, as follows:

17.76.020 - Permitted uses.

Except as otherwise provided, no new building, structure, or land use shall be permitted in the C-4 district, except:

1. Animal shelters, animal clinics, and animal boarding and treatment centers;
2. Assembly of devices or instruments, or packaging of products from previously prepared materials;
3. Automobile parks;
4. Automobile sales and repair areas and shops;
5. Automobile service stations, automobile service centers, and public garages;
6. Bed and breakfast;
7. Bed and breakfast homestay;
8. Bed and breakfast inn;
9. Builders' supply yards;
10. Churches;
11. Clubs and lodges;
12. Commercial dairies (excluding dairy farms);
13. Commercial laundries;
14. Convenience establishment, high volume;
15. Dance studios;
16. Day-care, adult;
17. Child care center;
18. Family child care center - zoning review;
19. Family child care home;
20. Family child care home - zoning review;
21. Drive-in/through facilities such as restaurants, package liquors, branch banks, etc.;
22. Farm implement sales and service;
23. Frozen food lockers;

24. Gaming/gambling
25. Greenhouses;
26. Grocery stores;
27. Group homes;
28. Heliports;
29. Homes for the homeless (emergency shelters);
30. Hotels, motels;
31. Kennels;
32. Manufactured home (mobile) sales;
33. Medical laboratories, clinics, health spas, rehabilitation centers, real estate brokers, insurance agents, and public health facilities;
34. Nurseries;
35. Offices, general and professional;
36. Parks, playgrounds, historical sites, golf courses, and other similar recreational facilities;
37. Pawn shops;
